TEINDS, *n. plur.* [Suio-Goth. *tiende*, the tenth part.] In *Scotch law*, the name for tithes. After the reformation, the whole teinds of Scotland were transferred to the *crown*, or to private individuals, called *titulars*, to whom they had been granted by the crown, or to *feuars*, or renters from the church, or to the original founding patrons, or to colleges or pious institutions. By a succession of decrees and enactments these tithes were generally rendered redeemable at a fixed valuation, but the clergy have now no right to the teinds beyond a suitable provision, called a stipend; so that teinds may now be described as that portion of the estates of the laity which is liable to be assessed for the stipend of the clergy. As a fund for the stipends of clergymen, teinds are under the administration of the court of session.—*Court of teinds*, a court in Scotland, otherwise called *Commissioners of teinds*. The powers conferred on this court are exercised by the judges of the court of session, as a parliamentary commission; but the court is distinct from the court of session, having a special jurisdiction, and a separate establishment of clerks and officers. Its jurisdiction extends to all matters respecting valuations and sales of

teinds, augmentations of stipends, pro-rations of tacks, and of teinds, and (with consent of three-fourths of the heritors of the respective parishes) the disjunction or annexation of parishes, and the building of new churches, &c. An appeal lies from this court to the house of lords.

TEINOSCOPE, *n.* [Gr. *τεῖνω*, to extend, and *σκοπία*, to see.] The name given by Sir David Brewster to an optical instrument, formed by combining prisms of the same kind of glass in such a manner that the chromatic aberration of the light is corrected. Dr. Brewster has proposed the construction of the object-glasses of telescopes on this principle.

TELEGRAPH, *n.* [Gr. *τῆλε*, at a distance, and *γραφία*, to write.] A machine for communicating intelligence from a distance by various signals or movements previously agreed on; which signals represent letters, words, or ideas which can be transmitted from one station to another, as far as the signals can be seen. The name *semaphore* is applied to some of the machines used for effecting telegraphic communication [see **SEMAPHORE**], and this term, in an extended signification, may be considered to embrace every means of conveying intelligence by gestures and visible signals, as flags, lanterns, rockets, blue lights, beacon fires, &c.; or by audible signals, as the firing of guns, the blowing of trumpets, the beating of drums, &c.; as well as by the machines called telegraphs or semaphores. For day signals the telegraph usually consists of a post of sufficient height, with two arms movable on the same pivot on the top of it, and a short arm, called the indicator, attached to one side of the upright post. The signals are made by varying the position of two arms, while the indicator shews the order or direction in which the signals are to be reckoned; that is, whether from right to left, or from left to right. To adapt the telegraph for night signals, a lantern is fixed to the pivot on which the arms move, and one is also attached to the extremity of each arm. In the management of a fleet at sea, telegraphic communication is indispensable. In the British navy, the signals are generally made by flags. The common or optical telegraph, which is always useless in hazy weather, is now superseded by the application of electricity or galvanism to the rapid communication of intelligence.—*Electric telegraph*, an apparatus for transmitting intelligence by means of voltaic electricity. Telegraphs of this kind are very various in the mechanical details of their construction; but they all depend on the electro-magnetic influence which a voltaic current is capable of exercising in its passage between the poles of the generating battery. The course

through which the current proceeds from, and returns to, the battery, is its *circuit*, and may be indefinitely prolonged by a conducting medium. A first and necessary, and, therefore, a general condition of the application of this agency to telegraphic purposes, consists consequently in the establishment of a connection between the telegraphic stations by at least one wire. This wire must likewise communicate at each extremity with an apparatus adapted to render the dynamical effects of the current visible in a definite and intelligible manner, and must likewise have communication with a voltaic generator. The common arrangement is such, that by turning a small handle at either station, complete metallic connection is obtained between the apparatus at the two stations, through the wire passing between them. The batteries are connected by wires with plates of metal at some depth in the ground, the moisture of which serves instead of a second wire to return the current to the generating battery. This circuit can be completed and broken, and the direction of the current reversed in the operation of telegraphing, by simply turning the handles before-mentioned; and the electric force, acting simultaneously on the apparatus at the respective stations, produces in them, in obedience to the will of the operator, those movements to which the species of mechanism is adapted, and which, having all preconcerted significations, are readily interpreted by the observer at the station to which the signals are transmitted. These features are common to all electric telegraphs; and the signalling apparatus, though subject to indefinite variations of mechanical detail, is reducible to two modes of action, depending on the two fundamental laws of electro-magnetism. In the *needle-telegraph*, which is that most commonly employed in this country, the movements depend on the famous discovery of Ørsted (1819), that a magnet placed within the influence of a voltaic current is invested with an artificial polarity, and being freely poised, is deflected tangentially to the direction of the current, as exemplified in the galvanometer,—*which see*. The essential part of the apparatus, therefore, consists of a movable magnet placed within a coil of the circuit-wire: the axis of the magnet is horizontal, and, projecting through a dial-plate, carries a pointer to indicate the movements of the magnet concealed in the wire-coil behind the dial. So long as the circuit is *open*, the pointer remains in a vertical position, but the moment the circuit is *closed*, it is deflected to the right or left, according to the direction of the current, and as the circuit can be opened and closed, and the current reversed many times in a minute, a corresponding number of movements of the magnet, and, consequently, also of the pointer in front of the dial, can be effected, and all that is requisite to render these movements significant is an agreement as to the symbol which each position and combination of positions of the pointer shall indicate. And as the apparatus at each station is precisely a counterpart of that at the other, the movements in both are exactly alike, and the attendants see their respective pointers deflect ex-

actly in the same way, in the same direction, the same number of times, and virtually at the same instant. But there being only two kinds of movements afforded by the *single-needle-telegraph*, that is, a movement to the right and another to the left, it is usually necessary to combine repetitions of these to denote a single letter of the alphabet, and, therefore, the rate of telegraphing is slow. To obviate this, the *double-needle-telegraph* is employed. In this there are two coils of wire, two magnets, having each a pointer or index-hand visible in front of the dial-face, and two wires to convey the electric current and its message between the stations. The circuits are closed and opened, and the currents reversed, by two small handles which communicate with the mechanism behind the dial. These handles can be worked simultaneously, alternately, and in any order of succession, and all these movements and combinations of movements being indicated by the pointers and made to represent signals, the rapidity of telegraphing is much increased. The principle of action is, however, in every respect the same as in the single instrument; the passage of the impulse from station to station is equally instantaneous in both, but there being fewer movements of the handles necessary to produce a given number of signals, the rate of telegraphing is correspondingly greater with the double instrument. Both instruments also agree in having a bell, by which the attention of the attendant is called to the instrument when a message is about to be transmitted to him from the distant station. The bell is made to ring by an arrangement in which the second electro-magnetic law is brought into action, viz., that a galvanic current, passing through a wire twisted round a piece of soft iron, renders the iron powerfully magnetic, a property which it instantly loses when the current is stopped. The applications of this principle are exceedingly numerous; in the present case, the arrangement is such that the current causes the movement of a small lever connected with the bell-hammer, which accordingly strikes, and thereby gives the requisite notice to the attendant. A separate wire extends between the two stations, to connect these apparatus, and to allow of their being worked independently of the signalling instruments. The second class of electric telegraphs all depend fundamentally on the principle here brought into action. When the iron is magnetic, it exerts an attractive force on another piece of iron; and this force ceasing with the interruption of the current—which may take place many times in a minute—this second piece of iron receives a movement to and fro, according as the attracting force is created and destroyed. This alternation of movement being generated, there are abundant means of transforming it so as to indicate symbols; and, in some cases, it is successfully applied to record its own indications in a permanent form, at a minimum rate of 100 letters a minute. Even very promising attempts have been made to transmit fac-similes of printed and written documents and drawings by adaptation of this principle. Time is also telegraphed by ana-

logous mechanism; and any number of clocks, at any distances apart, in the same voltaic circuit, may be worked synchronously with a standard clock. Telegraphs on the electro-magnetic principle may be indefinitely extended over a country, and may all be so connected one with another, that intelligence can be transmitted, through the same apparatus, from any number of stations with which it may be put in communication. The expense of their establishment consists chiefly in the connecting wires, which must necessarily be insulated from the ground, and protected against atmospheric influence. *Electric telegraphs* have of late years been brought into extensive use in this country, in the United States of America, and on the continent of Europe.

TELESCOPE, *n.* [Fr. from Gr. *τελος*, end, or *τηλε*, at a distance, probably the latter, and *σκοπειω*, to see; It. and Sp. *telescopio*.] An optical instrument by which distant objects are brought within the range of distinct vision. The *terrestrial* telescope enables the mariner to survey the ocean to the limits of the horizon, and discovers to the traveller inaccessible objects and distant scenery lying around and beyond his line of route. The *celestial* telescope unfolds the wonders of the universe, and the science of astronomy has advanced with the gradual improvement of this instrument. The *modus operandi*, or law of action, by which the telescope assists human vision, is two-fold, and that under all the varieties of its construction. A distant object, viewed by the unaided eye, is placed in the circumference of a large circle, having the eye for its centre; and, consequently, the angle under which it is seen is measured by the minute portion of the circumference which it occupies. Now, when the distance is great, it is found that this angle is too small to convey to the retina any sensible impression—all the light proceeding from the object is too weak to affect the optic nerve. This limit to distinct vision results from the small aperture, or pupil, of the eye. The telescope substitutes its large object

lens, or reflector, for the human eye, and consequently receives a quantity of light proportioned to its area or surface; hence, a distant point, inappreciable by the eye alone, is rendered visible by the aid of the telescope. The rays of light, after transmission or reflection, converge to a point, as they at first proceeded from a point; and thus an image of the object is formed, which, when viewed by the eye-piece, or lens, is more or less magnified. The telescope therefore assists the eye in these two ways: it gathers up additional light, and it magnifies the object—that is to say, its image. The *refracting* telescope is constructed of lenses alone, which, by successive refractions, produce the desired effect. This instrument was formerly very cumbersome and inconvenient, inasmuch as its length had to be increased considerably with every accession of power; and though the substitution of achromatic for ordinary lenses has rendered it more portable, its construction even at the present day does not enable it to compete with the reflecting telescope as an astronomical investigator. The *reflecting* telescope is composed of specula or concave reflectors, aided by a refracting eye-piece. To this instrument we owe the most wondrous discoveries in astronomical science. The names of Newton, Gregory, and Herschel are connected with its history; and in our own day, Lord Rosse has extended its powers as far, probably, as they can be carried with utility. The following diagrams exhibit the principles of construction and action in both sorts of telescopes.

In fig. 1. A and B are two lenses of different focal lengths. Rays of light from a distant object falling upon the object-glass, A, are converged to a focus at C. The eye-glass, B, placed at its focal distance from the point of convergence, gathers up the diverging rays and carries them parallel to the eye. The magnifying power of the instrument is as AC : CB, or as the focal length of one lens to that of the other. In this construction the object is inverted by the intersection of the rays, and hence it is unsuitable for terrestrial purposes. To render the image erect, a more complicated eye-piece, consisting of two additional lenses, is necessary. Fig. 2. shows the structure

of the reflecting telescope as constructed by Dr. Gregory. AB is a large speculum perforated in the centre; upon this fall the rays *a, b*, and *c, d*, which are reflected to convergence at *e*. A smaller speculum, C, takes up the diverging rays, and reflects them,

slightly converging, through the aperture o , where they are received by a lens, and, after transmission, they intersect at x , and proceed to the eye-glass, whence they emerge parallel. The magnifying power of this instrument is great for its length, being as $\frac{o e}{e C} \times \frac{x C}{x o}$. The Herschelian

telescope, invented by Sir William Herschel, is the one now generally used for astronomical purposes, as being the best and most powerful. In this construction there is no second speculum, and no perforation in the centre of the larger one placed at the bottom of the tube. The latter is fixed in an inclined position, so that the image formed by reflection falls near the lower side of the tube at its open end or mouth, where it is viewed directly by an eye-piece without greatly interfering with the light. This arrangement, in the case of large reflectors, is imposed by their great weight and difficult management; were it otherwise the ordinary construction would be preferred. The inclination of the speculum is a disadvantage.

The office was abolished by 4 and 5 Will. IV., c. 15, and the duties of the four tellers are now performed by a comptroller-general of the receipt and issue of the exchequer.

The graphic tellurium is steel gray; but sometimes white, yellow, or lead gray. These ores are found massive or crystallized. Tellurium is very brittle, and has a specific gravity of 6.26. It is very fusible, and volatile at a red heat. It sometimes gives forth an odour of decayed horse-radish during combustion, which Berzelius ascribes to the presence of minute portions of selenium.

To compound; to form by mixture; to qualify; as, by an ingredient; or, in general, to mix, unite, or combine two or more things so as to reduce the excess of the qualities of either, and bring the whole to the desired consistence or state.

TEMPERAMENT, *n.* [Fr. from *L. temperamentum*.] 1. Constitution; state with respect to the predominance of any quality; as, the *temperament* of the body. In *physiol.*, temperament has been defined as a peculiar organization of the system common to several individuals, which to a certain extent influences the thoughts and actions. There is besides in each individual a further peculiarity of organization, which serves to distinguish his temperament from that of any other person, to whom, however, he may in other respects bear a great resemblance. This individual temperament is called an *idiosyncrasy*. The ancient physicians enumerated four temperaments, viz., the *sanguine*, the *choleric*, the *phlegmatic*, and the *melancholic*. These terms are still in use among medical writers, and modern physiologists add a fifth, viz., the *nervous temperament*.—2. Medium; due mixture of different qualities.

The common law...has reduced the kingdom to its just state and *temperament*.

Hale.

3. In *music*, temperament is the accommodation or adjustment of the imperfect concords in musical instruments, by transferring a part of their defects to the more perfect ones, to remedy in part the false intervals of instruments of fixed sounds, as the organ, harpsichord, piano-forte, &c. To those acquainted with the theory of the musical scale, it is well known that all the concords cannot be made perfect. The interval of a tone is not always the same; for instance, that lying between the fourth and fifth of the scale contains nine small parts called *commas*; whereas that between the fifth and the sixth of the major scale, contains only eight *commas*. Again, the diatonic semitone contains five *commas*, and the chromatic semitone three or four, according to the magnitude of the tone. These inequalities in the intervals of the scale are a source of imperfection in musical instruments whose sounds are fixed, and it is impossible altogether to

remedy the imperfection. If, for example, a piano-forte be tuned by a series of perfect octaves from the lowest C to the highest, and if another piano-forte be tuned from the same pitch by a series of perfect 6ths, ending

with B[♯], it will be found that this last note is not in tune with the upper C of the first piano-forte, being higher by a comma; but on the piano-forte B[♯]

being played on the same key as C, should be identically the same sound; therefore this discrepancy must be removed by a proper adjustment. Again, on the piano-forte three successive major thirds form an octave. Now, should these three successive thirds be tuned perfect to each other, it will be found that they fall short of the perfect octave by a comma, so that one, two, or all of the thirds must be altered and tuned sharper than perfect thirds, to compensate for the deficiency. Four successive minor thirds will, on the other hand, be found to exceed the octave by a comma, which defect must be removed by flattening. These slight alterations, which are made in order that any one of the twelve semitones which compose an octave may be fit to be used as a key note, without any shock to the ear, constitute what is termed the *temperament* of the scale; and the altered consonances are said to be *tempered*. There are in use two modes of temperament, the *equal* and the *unequal*. *Equal temperament* is that mode in which the necessary defects of the scale are distributed equally throughout it; and *unequal temperament*, that in which the defects are unequally distributed, so as to make some keys feel them less than others. The most common practice among tuners of the present day is to aim at equal temperament, but this is very difficult to accomplish; whereas the unequal temperament is easily obtained in tuning, and has the additional advantage of giving to every one of the twelve major and minor scales a particular character.

The harshness of a given concord increases with the *temperament*. *Prof. Fisher.*
TEMPERAMENTAL, *a.* Constitutional. [*Not much used.*]

TEMPERANCE, *n.* [Fr. from *L. temperantia*, from *tempero*.] 1. Moderation; particularly, habitual moderation in regard to the indulgence of the natural appetites and passions; restrained or moderate indulgence; as, *temperance* in eating and drinking; *temperance* in the indulgence of joy or mirth. *Temperance* in eating and drinking is opposed to *gluttony* and *drunkenness*, and in other indulgences, to *excess*.—2. Patience; calmness; sedateness; moderation of passion. He calm'd his wrath with goodly *temperance*.

[*Unusual.*] *Spenser.*
Temperance societies are associations formed for the purpose of repressing drunkenness, and banishing it from society. The basis on which these associations have generally been formed, has been that of an engagement on the part of each member to abstain from the use of ardent spirits, except for medicinal purposes, and to forbear to provide them for the entertainment of friends or the supply of dependents. Many such associations exist in this country, and also in the United States

of America, and although considerable difference of opinion exists as to the soundness of the principle on which they are based, it must nevertheless be allowed by all that they have been productive of much good. They are, however, more appropriately designated *abstinence* or *abstinent societies*, than *temperance societies*. [See *ABSTINENCE*.]

TEMPERANCE, *a.* Belonging to temperance, or moderation in the use of strong drinks, almost or quite to the extent of abstinence; as, the *temperance* movement.

TEMPERATE, *a.* [L. *temperatus*.]

Be sober and *temperate*, and you will be healthy. *Franklin*.

3. Cool; calm; not marked with passion; not violent; as, a *temperate* discourse or address; *temperate* language.—4. Proceeding from temperance; as, *temperate* sleep.—5. Free from ardent passion.

She is not hot, but *temperate* as the morn.

Shak.

Temperate zones, the spaces on the earth between the tropics and the polar circles, where the heat is less than in the tropics, and the cold less than in the polar circles. The *North temperate zone*, is the space included between the tropic of Cancer and the arctic circle; and the *South temperate zone*, that between the tropic of Capricorn and the antarctic circle. [See *ZONE*.]

TEMPERATENESS, *n.* Moderation; freedom from excess; as, the *temperateness* of the weather or of a climate.—2. Calmness; coolness of mind.

TEMPERATIVE, *a.* Having the power or quality of tempering.

TEMPERATURE, *n.* [Fr. from L. *temperatura*.] 1. In *physics*, the state of a body with regard to heat or cold, as indicated by the thermometer, or generally by its effects on other bodies; or the degree of free caloric which a body possesses, when compared with other bodies. When a body applied to another, expands that body, we say it is of a *higher temperature*; that is, it possesses more free caloric. When it contracts another body, it is said to be of a *lower temperature*. Thus we speak of the *temperature* of air, of water, of a climate, &c.; two countries of the same *temperature*.—*Mean temperature of a place*, a mean of all the temperatures observed at that place at regular intervals during a certain space of time. The mean annual temperature of any place is obtained by taking a mean of all the temperatures indicated by the thermometer each day throughout the year. Springs in which the water does not considerably change its heat from one season of the year to another, afford an expeditious and accurate way of ascertaining the mean temperature of a place. Every place on the earth's surface has a mean temperature, which remains always nearly the same, and

which decreases from the equator to either pole, according to a certain law. The mean temperature at the equator is estimated at 81°. The temperature of a place depends not only on its latitude, but also on its elevation above the level of the sea, and various other local causes, such as the nature of the soil, the prevailing winds, the quantity of moisture, the electric state of the atmosphere, and the physical character of the adjacent countries and seas. But no cause has such an effect in lowering the temperature of a place as elevation above the level of the sea; and hence near the equator and tropics there are mountains which, owing to their great elevation, are covered with snow all the year round. [See *SNOW-LINE*.] The temperature of the sea is more uniform and moderate than that of the land. For ascertaining temperatures below 600° the thermometer is used, but for temperatures above 600°, instruments called pyrometers are employed.—2. Constitution; state; degree of any quality.

Memory depends upon the consistence and *temperature* of the brain. *Watts*.

3. Moderation; freedom from immoderate passions.

In that proud port, which her so goodly graceth,

Most goodly *temperature* you may descry. [Not in use.] *Spenser*.

TEMPERING, *ppr.* Mixing and qualifying; qualifying by mixture; softening; mollifying; reducing to a state of moderation; hardening.

TEMPERING, *n.* The process of giving iron or steel, especially the latter, the different degrees of hardness required for the various purposes to which it is applied. The excellence of all cutting steel instruments depends on the degree of temper given to them. Different degrees of temper are indicated by different colours which the steel assumes. Thus, steel heated to 450°, and suddenly cooled, assumes a pale straw colour, and is employed for making razors and surgical instruments. [See *STEEL*.]

TEMPEST, *n.* [Fr. *tempête*; L. *tempestas*; Sp. *tempestad*; It. *tempesta*; from L. *tempus*, time, season. The primary sense of *tempus*, time, is a falling, or that which falls, comes, or happens, from some verb which signifies to fall or come suddenly, or rather to drive, to rush. *Time* is properly a coming, a season, that which presents itself, or is present. The sense of *tempest* is from the sense of rushing or driving. See *TEMERITY* and *TEMERARIOUS*.] 1. An extensive current of wind, rushing with great velocity and violence, and commonly attended with rain, hail, or snow; a storm of extreme violence. We usually apply the word to a steady wind of long continuance; but we say also of a tornado, it blew a *tempest*. The currents of wind are named, according to their respective degrees of force or rapidity, a *breeze*, a *gale*, a *storm*, a *tempest*; but *gale* is also used as synonymous with *storm*, and *storm* with *tempest*. *Gust* is usually applied to a sudden blast of short

duration. A *tempest* may or may not be attended with rain, snow, or hail. We, caught in a fiery *tempest*, shall be hurld Each on his rock transfixed. *Milton*.

2. A violent tumult or commotion; as, a popular or political *tempest*; the *tempest* of war.—3. Perturbation; violent agitation; as, a *tempest* of the passions. **TEMPEST**, *v. t.* To disturb, as by a *tempest*. [Little used.]

pilgrims travelling to the Holy Land. The order originated with some persons who, in 1118, devoted themselves to the service of God, promising to live in perpetual chastity, obedience, and poverty, after the manner of canons. In 1228, this order was confirmed in the council of Troyes, and subjected to a rule of discipline. It flourished, became immensely rich, and its members became so insolent and vicious, that the order was suppressed by the council of Vienna, in 1312.—2. A student of the law.

TEMPLE, *n.* In *arch.*, a short piece of timber laid under the end of a beam or girder, resting on a wall, to distribute the weight over a large space.

TEMPLE, *n.* [Fr.; L. *templum*; It. *tempio*; W. *temyl*, temple, that is, ex-

tended, a seat; *temlu*, to form a seat, expanse, or temple; Gaelic, *teampul*.] 1. A public edifice erected in honour of some deity. Among pagans, a building erected to some pretended deity, and in which the people assembled to worship. Originally, temples were open places, as the Stonehenge in England. In Rome, some of the temples were open, and called *sacella*; others were roofed, and called *ædes*. The most celebrated of the ancient pagan temples were that of Belus in Babylon, that of Vulcan at Memphis, that of Jupiter at Thebes, that of Diana at Ephesus, that of Apollo in Miletus, that of Jupiter Olympius in Athens, and that of Apollo at Delphi. The most celebrated and magnificent temple erected to the true God, was that built by Solomon in Jerusalem. The form most generally given to the ancient temples was that of a rectangle, but sometimes the construction was circular. Vitruvius divides temples into eight kinds, according to the arrangement of their columns, viz., temples in *antis* [see *ANTÆ*], *prostyle*, *amphiprostyle*, *peripteral*, *dipteral*, *pseudo-dipteral*, *hypæthral*, and *monopteral*. [See *these terms*.] In regard to intercolumniation, they were farther distinguished into *pyncostyle*, *systyle*, *eustyle*, *diastyle*, and *aræostyle*. [See *these terms*.] Of circular temples there are two species, the *monopteral*, without a cell, and the *peripteral*, with a cell.—In *Scripture*, the tabernacle is sometimes called by this name; 1 Sam. i.—iii.—2. A church; an edifice erected among Christians as a place of public worship.

Can he whose life is a perpetual insult to the authority of God, enter with any pleasure a temple consecrated to devotion and sanctified by prayer? *Buckminster*. 3. A place in which the divine presence specially resides; the church as a collective body; Eph. ii.—4. The name of two semi-monastic establishments of the middle ages, one in London, the other in Paris, inhabited by the knights Templars. The Temple Church, London, is the only portion of either establishment now existing. On the site of both, modern edifices have been erected, those in London forming the two Inns of Court, called the Middle Temple and Inner Temple.

TEMPO, *n*. [It.] In *music*, a word used to express time, or the degree of quickness with which a piece of music is to be executed. The degrees of time, generally speaking, are five, and are designated by the terms *largo*, *adagio*, *andante*, *allegro*, and *presto*; and the intermediate degrees are expressed by additions to these terms. A *tempo*, denotes that the former time is to be resumed, or a more distinct time observed.

In this sense, it is opposed to *spiritual*. Let not *temporal* affairs or employments divert the mind from *spiritual* concerns, which are far more important. In this sense also it is opposed to *ecclesiastical*; as, *temporal* power, that is, secular, civil, or political power; *temporal* courts, those which take cognizance of civil suits. *Temporal* jurisdiction is that which regards civil and political affairs.—2. Measured or limited by time, or by this life or this state of things; having limited existence; opposed to *eternal*.

The *temporal bones* are two bones situated one on each side of the head, of a very irregular figure. They are connected with the occipital, parietal, sphenoid, and cheek bones, and are articulated with the lower jaw. The *temporal artery* is a branch of the external carotid, which runs on the temple, and gives off the frontal artery. The *temporal muscle* of the lower jaw, situated in the temple, serves to draw the lower jaw upwards, as in the action of biting.

TEMPORALITIES, } *n*. Secular pos-

The *temporality of benefices*, in *Scots law*, consists in such lands or other property (except tithes, manses, and glebes) as may have accrued to the church, by gifts to, or purchases by, its members as such. TEN, *a.* [Sax. *tyrn*; D. *tien*; G. *zehn*.]

TEN'ABLENESS, } *n.* The state of
TENABILITY, } being tenable.

TENA'CIOUS, *a.* [L. *tenax*, from *teneo*, to hold; Fr. *tenace*.] 1. Holding fast, or inclined to hold fast; inclined to retain what is in possession; as, men *tenacious* of their just rights. Men are usually *tenacious* of their opinions, as well as of their property.—2. Retentive; apt to retain long what is committed to it; as, a *tenacious* memory.

—3. Adhesive; apt to adhere to another substance; as oily, glutinous, or viscous matter. Few substances are so *tenacious* as tar.—4. Niggardly; close fistcd.—5. In *physics*, tough; having great cohesive force among the particles, so that they resist any effort to pull or force them asunder. Iron and steel are the most *tenacious* of all known substances.

TENA'CIOUSLY, *adv.* With a disposition to hold fast what is possessed.—2. Adhesively; with cohesive force.—3. Obstinate; with firm adherence.

TENA'CIOUSNESS, *n.* The quality of holding fast; unwillingness to quit, resign, or let go; as, a man's *tenaciousness* of his rights or opinions.—2. Adhesiveness; stickiness; as, the *tenaciousness* of clay or glue.—3. Retentive-

ness; as, the *tenaciousness* of memory.—4. In *physics*, the same as *tenacity*, but less used. [See **TENACITY**.]

TENACITY, *n.* [Fr. *tenacité*; L. *tenacitas*, from *teneo*, to hold.] 1. Adhesiveness; that quality of bodies which makes them stick or adhere to others; glutinousness; stickiness; as, the *tenacity* of oils, of glue, of tar, of starch, and the like.—2. In *physics*, that property of material bodies by which their parts resist an effort to force or pull them asunder; cohesive force; in common language, toughness. It is opposed to *brittleness*, or *fragility*. Tenacity results from the attraction of cohesion which exists between the particles of bodies, and the stronger this attraction is in any body, the greater is the *tenacity* of the body. Tenacity is consequently different in different materials, and in the same material it varies with the state of the body in regard to temperature and other circumstances. The *tenacity* of different kinds of wood and metal is ascertained by taking rods of them, fixing these immovably at one end, and finding what weight suspended at the other is sufficient to overcome the cohesive force, and break or pull asunder the rods; the weights being considered as the measures of *tenacity* in the different kinds of materials. Of the different kinds of wood the most *tenacious* is fir; but of all substances, iron and steel are the most *tenacious*, and steel much more so than iron. The *tenacity* of iron is a subject of the greatest importance, as the stability and strength of suspension bridges depend upon it.

TENAC'ULUM, *n.* [from L. *teneo*, to hold; to seize.] A surgical instrument for seizing and drawing out the mouths of bleeding arteries in operations, so that they may be secured by ligaments. For this purpose it has a hooked extremity with a fine sharp point.

TEN'ACY, † *n.* Tenaciousness.

TENAIL, } *n.* **TENAILLE**, from
TENAILLE, } *tenir*; L. *teneo*, to hold.]

In *fort*, an outwork or rampart raised in the main ditch, immediately in front of the curtain, between two bastions. In its simplest form, it consists of two faces forming with each other a re-entering angle; but generally it consists of three faces forming two re-entering angles, in which case it is called a *double tenaille*. Any work belonging either to permanent or field fortification, which, on the plan, consists of a succession of lines forming salient and re-entering angles alternately, is said to be à *tenaille*. [See **RAVELIN**.]

TENAIL'LON, *n.* In *fort*, *tenaillons* are works constructed on each side of the ravelins, like the lunettes, but differing in this, that one of the faces of the tenailion is in the direction of the ravelin, whereas that of the lunette is perpendicular to it. Works of this kind, however, are seldom adopted.

TEN'ANCY, *n.* [Sp. *tenencia*; Fr. *tenant*; L. *tenens*.] In *law*, a holding or possession of lands or tenements from year to year, for a term of years, for a life or lives, or at will; tenure; as, *tenancy* in fee simple; *tenancy* in tail; *tenancy* by the courtesy; *tenancy* at will. *Tenancy* in common happens where there is a unity of possession merely.

TEN'ANT, *n.* [Fr. *tenant*, from *tenir*, to

hold; L. *teneo*; Gr. *τενω*, to strain, stretch, extend; W. *tanu*, to stretch; *tynu*, to pull; *tyrn*, a stretch; *ten*, drawn; *It. tenere*; Sp. *tener*, to hold.]

1. A person who holds or possesses lands or tenements by any kind of title, either in fee, for life, for years, or at will. The word in English law is used with several additions. Thus, *tenant in dower*, is she that possesses land by virtue of her dower; *tenant by the courtesy*, he that holds for his life, by reason of a child begotten of him by his wife, being an heirress; *tenant in mortgage*, he that holds by means of a mortgage; *tenant by the verge in ancient demesne*, one who is admitted by the rod in the court of ancient demesne. [See **VERGE**.]—*Tenant by copy of court roll*, one who is admitted tenant of any lands, &c., within a manor; *tenant in fee simple*, one who has lands or tenements to hold to him and his heirs for ever; *tenant in fee-tail*. [See **TAIL**.] *Tenant at will*, is where lands or tenements are let by one man to another, to have, and to hold to him at the will of the lessor, by force of which letting the lessee is in possession, but the lessor may put him out at whatever time he pleases; *tenant from year to year*, is where one lets lands or tenements to another without limiting any certain or determinate estate; *tenant by lease*. [See **LEASE**.] *Tenant upon sufferance*, he who enters by lawful letting or title, and afterwards wrongfully continues in possession; *joint-tenants* are such as have equal rights in lands and tenements by virtue of one title; *tenants in common*, those who have equal rights, but held by divers titles. The word *tenant*, in the most ordinary acceptation, signifies one who holds lands or houses under another, to whom he is bound to pay rent, and who is called his landlord. In *Scotland*, the term *tenant* is used only for the lessee or party to whom a lease is granted.—2. One who has possession of any place; a dweller.

The happy *tenant* of your shade. *Cowley.*

Tenant in capite, or *tenant in chief*, by the laws of England, is one who holds immediately of the king. According to the feudal system, all lands in England are considered as held immediately or mediately of the king, who is styled lord paramount. Such tenants, however, are considered as having the fee of the lands and permanent possession.

TEN'ANT, *v. t.* To hold or possess as a tenant.

Sir Roger's estate is *tenanted* by persons who have served him or his ancestors.

Addison.

TEN'ANT, *ppr.* [Fr.] In *her.*, a French term for *holding*, but met with in English *holding*.

In *English law*, the manner of holding lands and tenements of a superior, or the feudal relation which subsists between lord and vassal in respect of lands and tenements. All land is held of the king, either mediately or immediately; and ultimately all land is held of the king. The ownership of land is therefore never unlimited as to extent, for he who is the owner of land in fee, which is the largest estate that a man can have in land, is not absolute owner: he owes services in respect of his fee (or fief), and the lordship of the land always subsists. All land in the hands of any layman is held of some lord, to whom the holder or tenant owes some service; but in the case of church lands, although they are held by tenure, no temporal services are due, but the lord of whom these lands are held must be considered the owner, although the

beneficial ownership can never revert to the lord. All the species of ancient tenures may be reduced to four, three of which subsist to this day. 1. Tenure by knight service, which was the most honourable. This is now abolished. 2. Tenure in free socage, or by a certain and determinate service, which is either free and honourable, or villain and base. 3. Tenure by copy of court roll, or copyhold tenure. 4. Tenure in ancient demain. There was also tenure in frankalmoigne, or free arms. The tenure in free and common socage has absorbed most of the others. [See **TENANT**, **COPYHOLD**, **SOCAGE**, **VILLEINAGE**.]—In *Scots law*. [See **HOLDING**.] —2. The consideration, condition, or service which the occupier of land gives to his lord or superior for the use of his land.—3. Manner of holding in general. In absolute governments, men hold their rights by a precarious tenure.

A *term* of years signifies the estate and interest which pass to the person to whom an estate for years is granted by the owner of the fee.—5. The *law terms* are those portions of the year during which the superior courts of common law and equity sit for the despatch of business. They are four in number, viz., Hilary term, which begins on the 11th, and ends on the 31st January; Easter term, which begins on the 15th April, and ends on the 8th May; Trinity term, which begins on the 22d May, and ends on the 12th June; Michaelmas term, which begins on the 2d, and ends on the 25th November. The other portions of the year are termed *vacation*. In all cases the Monday is substituted for the Sunday, when the first day of term falls on the latter day. The courts of common law are empowered, upon giving notice, to hold sittings out of term. In *England*, there are also four days in the year which are called terms, and which are appointed for the settling of rents, viz., Lady Day, March

25; Midsummer, June 24; Michaelmas Day, September 29; Christmas, December 25. The terms in Scotland corresponding to these are Candlemas, February 2; Whitsunday, May 15; Lammas, August 1; Martinmas, November 11. The legal terms in Scotland for the payment of rent, or interest, are Whitsunday, 15th May, and Martinmas, November 11th.—*Conventional terms* are any terms agreed upon between the contracting parties. A term may consist of one word, or of several, but every word is not capable of being employed by itself as a term. Terms are divided into *simple*, *singular*, *universal*, *common*, *univocal*, *equivocal*, *analogous*, *abstract*, *concrete*, &c. A syllogism consists of three terms, the major, the minor, and the middle. The predicate of the conclusion is called the major term, because it is the most general, and the subject of the conclusion is called the minor term, because it is less general. These are called the extremes; and the third term, introduced as a common measure between them, is called the mean or middle term. Thus, in the following syllogism: Every vegetable is combustible; every tree is a vegetable; therefore every tree is combustible. *Combustible* is the predicate of the conclusion, or the major term; every tree is the minor term; *vegetable* is the middle term.—10. In *arch.*, a kind of statues or columns adorned on the top with the figure of a head, either of a man, woman, or satyr. These were dedicated to Mercury, who was supposed to preside over highways.—12. In *alge.*, a member of a compound quantity; as, *a*, in $a + b$; or *ab*, in $ab + cd$. Hence, the terms of any compound quantity are the several members of which it is composed, separated from one another by the signs $+$, plus, or $-$, minus. Thus, $a^2 b^3 x^2 - 2 a b x^3 + \sqrt{ab} x^4$, is a compound quantity, consisting of three terms. Terms of an equation, the several parts of which it is composed, connected by the signs of addition and subtraction. Thus, $x^3 - 6x^2 + 11x - 6 = 0$, is an equation consisting of four terms.—13. Among *physicians*, the monthly uterine secretion of females is called terms.—14. In *contracts*, terms, in the plural, are condi-

tions; propositions stated or promises made, which, when assented to or accepted by another, settle the contract and bind the parties. TERMITES, } *n.* A family of nen-
TERMITIDÆ, } ropterous insects,
 known by the name of white ants. It includes the genus *Termes*, Linn. These insects have little affinity with the true ants, although they resemble them in their mode of life. They are chiefly confined to the tropics; and are found very plentifully in western Africa; they unite in societies, each composed of an immense number of individuals, living in the ground and in trees, devouring all vegetable and animal substances within their reach, and often attacking the wood-work of houses. The white ants build their dwellings in the ground, in the form of pyramids or cones, ten or twelve feet high, resembling native villages in extent, and for which indeed they may readily be mistaken. These dwellings, which are so firmly cemented as to be capable of bearing the weight of three or four men, are divided off into several apartments as magazines, chambers, galleries, &c. When assaulted, the ants make their attack and defence with system and desperate courage. After impregnation, the abdomen of the female extends to an enormous size, exceeding the rest of her body nearly 2000 times; in which state it is filled with an immense number of eggs, protruded to the amount of about 8000 in 24 hours.

Termes bellicosus.

a, Larva or worker; } Natural size.
 b, Pupa or soldier; }
 c, Perfect winged insect reduced in size.

On emerging from the egg, the insects, in their larva state, are furnished with a great hard head and strong toothed jaws, but destitute of eyes. These are the labourers, *a*, who, although not more than a quarter of an inch long, build their edifices, procure provisions for the community, and take care of the eggs. On changing to the pupa state, *b*, they become larger and more powerful; the head is nearly as big as the body, while the jaws project beyond the head, and are very sharp, but without teeth. They now become soldiers and never work themselves, but superintend the labourers, and act as guards to defend the common habitation from violence and intrusion. The next change brings the pupæ or soldiers to their perfect state, as male or female winged insects, *c*. These emerge into the air during the night, or on a damp and cloudy day; in a few hours, however, the solar heat causes their wings to wither and become dry; the insects then fall to the ground, and are eagerly sought after by hosts of birds, lizards, and even negroes themselves, who roast and eat them.

TESTAMENT, *n.* [Fr. from L. *testamentum*, from *testor*, to make a will.]

1. A solemn authentic instrument in writing, by which a person declares his will as to the disposal of his estate and effects after his death. This is otherwise called a *will*, but in strictness of language, the term *will* is limited to land, and *testament* to personal estate. A *testament*, to be valid, must be made when the testator is of sound mind, and it must be written, subscribed, &c., in such manner as the law prescribes. In *Scots law*, the word *testament*, in the strictly legal acceptation, signifies a deed in writing, by which the grantor appoints an executor, that is, a person to administer his movable estate after his death, for the behoof of all who may be interested in it. A testament may thus consist merely of the nomination of an executor, or it may contain, along with such a nomination, clauses bequeathing, in the form of legacies, either the whole or part of the movable estate. In its more common meaning, however, a testament is a declaration of what a person will to be done with his movable estate, after his death. Any person has power to execute an effectual testament who is of sound mind at the time, although he be labouring under bodily sickness, or even be on death-bed. A testament is effectual only with regard to the movable estate of the testator, and even in regard to things strictly movable, a person cannot dispose by testament of more than

that share of them which is termed the dead's part; he must not encroach upon the *jus relictae*, or *legitim*. [See *these terms*.] A testament may be revoked at any time during the life of the testator. All testaments containing the nomination of an executor, or the bequest of a legacy of greater value than £100 Scots, must be in writing, and properly tested and signed before witnesses, but if it be in the testator's own handwriting, witnesses are not required. [For more information respecting testaments and wills in English and Scots law, see WILL. See also NUNCUPATIVE.]—2. Lacerated wounds of tendinous parts prove, in warm climates, a never-failing source of these complaints. In cold climates as well as in warm, the locked jaw (in which the spasms are confined to the muscles of the jaw or throat,) frequently arises in consequence of the amputation of a limb, or from lacerated wounds. These are the true grouse, but the term grouse is also extended to the ptarmigans.

TETRAO'NIDÆ, *n.* The grouse family, the third family of the Rasores in the arrangement of Swainson. It is composed of the partridges, grouse, and quails, all of which agree in the extreme shortness of their tails, and of their hind-toe. In the quails we have a miniature resemblance of partridges, but the tail is so short as to be scarcely perceptible. Grouse inhabit Europe, Asia, Africa, and America, and abound chiefly in heathy mountains and plains, and piny forests, at a distance from mankind. The black cock (*Tetrao tetrix*); the red grouse (*Lagopus scoticus*); and the common ptarmigan (*Lagopus mutus*) are British species. The Germans express the sense by *als*, as.] This word is placed after some comparative adjective or adverb, to express comparison between what precedes and what follows. Thus Elijah said, I am not better *than* my fathers. Wisdom is better *than* strength. Israel loved Joseph more *than* all his children. All nations are counted less *than* nothing. I who am less *than* the least of all saints. The last error shall be worse *than* the first. He that denies the faith is worse *than* an infidel. It also often follows *other*, and even *else*. After *more*, or an equivalent termination, the following word implies *less*, or *worse*; after *less*, or an equivalent termination, it implies *more* or *better*.

THANAGE, *n.* The land granted to a thane; the district in which the thane anciently presided.

THANE, *n.* [Sax. *thegn*, *thægn*, a minister or servant; *thegnian*, *thenian*, to serve; D. and G. *diener*, to serve; Sw. *tienna*, to serve; *tienaar*, a servant; Dan. *tiener*, to serve; *tiener*, a servant.] In early *Eng. hist.*, a title of honour belonging to the Anglo-Saxon nobility. In its original meaning, it signified a minister or honourable retainer, and was applied to the followers of kings and chieftains. The thanes in England were formerly persons of some dignity; of these there were two orders, the king's thanes, who attended the Saxon and Danish kings in their courts, and held lands immediately of them; and the ordinary thanes, who were lords of manors, and who had a particular jurisdiction within their limits. In a later age of the Anglo-Saxon power, the term *thane* seems to have been applied to all landed proprietors who were below the rank of earl, and above that of alderman, and had the privilege of assisting in framing the laws. The rank of thane implied the possession of a certain amount of landed property, and five hides of land is supposed to have been the amount required for a thane of the highest order. After the Conquest, this title was disused, and *baron* took its place. In *Scotland*, *thane* was a recognised title down to the end of the 15th century, and it appears to have implied from the first a higher dignity than in England, and to have been, for the most part, synonymous with *earl*, which title was generally annexed to the territory of a whole county.

THANEDOM, *n.* The property or jurisdiction of a thane.

THANE-LANDS, *n.* Lands granted to thanes.

THANESHIP, *n.* The state or dignity of a thane; or his seignory.

THANK, *v. t.* [Sax. *thancian*; G. and D. *danhen*; Ice. *thacka*; Sw. *tacka*; Dan. *takker*. We see by the Gothic dialects that *n* is not radical. To ascertain the primary sense, let us attend to its compounds; G. *abdanhen*, [which in English would be *off-thank*,] to dismiss, discharge, discard, send away, put off, to disband or break, as an officer; *verdanken*, to owe or be indebted; D. *afdanhen*, to cashier or discharge. These senses imply a sending. Hence, *thank* is probably from the sense of giving, that is, a render or return.] 1. To express gratitude for a favour; to make acknowledgments to one for kindness bestowed.

We are bound to *thank* God always for you; 2 Thess. i.

They are perennial herbs, with doubly or trebly pinnate leaves, large compound umbels, and yellow flowers. The roots possess acrid and corrosive properties. The root of *T. villosa*, when applied to the skin, causes inflammation and vesication.—*T. silphium*, a native of the north of Africa, is supposed to be the plant which produced the juice called Silphium, which was much prized by the ancients.

THAR, *n.* A species of antelope.

THARM, *n.* [Sax. *thærm*; G. and D. *darm*.] Intestines twisted into a cord. [*Local*.]

THAT, *an adjective, pronoun, or substitute.* [Sax. *that*, *that*; Goth. *thattu*; D. *dat*; G. *das*. Qu. Gr. *ταυτος*. This word is called, in Saxon and German, an article, for it sometimes signifies *the*. It is called also, in Saxon, a pronoun, equivalent to *id*, *istud*, in Latin. In Swedish and Danish it is called a pronoun of the neuter gender. But these distinctions are groundless and of no use. It is probably from the sense of setting.] 1. *That* is a word used as a definitive adjective, pointing to a certain person or thing before mentioned, or supposed to be understood. "Here is that book we have been seeking this hour." "Here goes that man we were talking of."

It shall be more tolerable for Sodom and Gomorrah in the day of judgment, than for that city; Matt. x.

2. *That* is used definitively, to designate a specific thing or person emphatically.

The woman was made whole from that hour; Matt. ix.

In these cases, *that* is an adjective. In the two first examples, *the* may be substituted for it. "Here is the book we have been seeking." "Here goes the man we were talking of." But in other cases, *the* cannot supply its place, and *that* may be considered as more emphatically definitive than *the*.—3. *That* is used as the representative of a noun, either a person or a thing. In this use it is often a pronoun and a relative. When it refers to persons, it is equivalent to *who*, and when it refers to a thing, it is equivalent to *which*. In this use, it represents either the singular number or the plural.

He *that* reproveh a scorner, getteth to himself shame; Prov. ix.

They *that* hate me without a cause, are more than the hairs of my head; Ps. lxxiii.

A judgment *that* is equal and impartial, must incline to the greater probabilities.

Wilkins.

They shall gather out of his kingdom all things *that* offend; Matt. xiii.

4. *That* is also the representative of a sentence or part of a sentence, and often of a series of sentences. In this case, *that* is not strictly a pronoun, a word standing for a noun; but is, so to speak, a *pro-sentence*, the substitute for a sentence, to save the repetition of it.

And when Moses heard *that*, he was content; Lev. x.

That here stands for the whole of what Aaron had said, or the whole of the preceding verse.

I will know your business, *that* I will.

Shak.

Ye defraud, and *that* your brethren; 1 Cor. vi.

That sometimes in this use, precedes the sentence or clause to which it refers.

That be far from thee, to do after this manner, to slay the righteous with the wicked; Gen. xviii.

That here represents the clause in italics.—5. *That* sometimes is the substitute for an adjective. You allege that the man is *innocent*; *that* he is not.—6. *That*, in the following use, has been called a conjunction. "I heard that the Greeks had defeated the Turks." But in this case, *that* has the same character as in No. 4. It is the representative of the part of the sentence which follows, as may be seen by inverting the order of the clauses.

"The Greeks had defeated the Turks: I heard *that*." "It is not *that* I love you less." *That* here refers to the latter clause of the sentence, as a kind of demonstrative.—7. *That* was formerly used for *that which*, like *what*.

We speak *that* we do know, and testify *that* we have seen; John iii.

[This use is no longer held legitimate.]

—8. *That* is used in opposition to *this*, or by way of distinction.

If the Lord will, we shall live, and do *this* or *that*; James iv.

9. When *this* and *that* refer to foregoing words, *this*, like the Latin *hic* and French *ceci*, refers to the latter, and *that* to the former. It is the same with *these* and *those*.

Self-love and *reason* to one end aspire, Pain their aversion, pleasure their desire; But greedy *that*, its object would devour, *This* taste the honey, and not wound the flower. *Pope.*

10. *That* sometimes introduces an explanation of something going before. "Religion consists in living up to those principles; *that* is, in acting in conformity to them." Here *that* refers to the whole first clause of the sentence.

—11. "Things are preached, not in *that* they are taught, but in *that* they are published." Here *that* refers to the words which follow it. So when *that* begins a sentence. "*That* we may fully understand the subject, let us consider the following propositions."

That denotes purpose, or rather introduces the clause expressing purpose, as will appear by restoring the sentence to its natural order. "Let us consider the following propositions, *that*, [for the purpose expressed in the following clause,] we may fully understand the subject." "Attend *that* you may receive instruction." Here also *that* expresses purpose elliptically; "Attend for the purpose *that* you may receive instruction," *that* referring to the last noun.

This elliptical use of *that* is very frequent; the preposition *for* being understood. "A man travels *that* he may regain his health." He travels *for that* purpose, he may regain his health. The French often retains the preposition in such cases, *pour que*. "Do all things without murmurings and disputings, *that* ye may be blameless and harmless." Phil. ii. 14. Do all things without murmurings, *for that* purpose; *to that* effect, ye may be blameless.—*In that*, a phrase denoting consequence, cause, or reason; *that* referring to the following sentence.

THATCH, *n.* [Sax. *thac*, connected with *theccan*, *thecan*, to cover; L. *tego*, Eng. *deck*; G. *dach*, a roof; D. *dak*; Sw. *tak*; Dan. *tag*, *tække*; Gaelic, *tughe*, *tuighe*. The primary sense is to put on, to spread over or make close.] Straw, rushes, reeds, heath, &c., used to cover the roofs of buildings, or stacks of hay or grain, for securing them from rain, &c.

THAUMATROPE, *n.* [Gr. *θαυμα*, a wonder, and *τροπον*, to turn.] An optical toy contrived by Dr. Paris, the principle of which depends on the persistence of vision, or on the well-known fact, that when a person whirls a burning stick rapidly round, a complete circle of light is seen marking out the path described by the burning end. It consists of a circular card, having two silk strings fixed to it at the extremities of a diameter. By twisting the silk strings with the finger and thumb of each hand, it may be twirled round with considerable rapidity. On one side of the card there is drawn any object, such as a chariot, and on the other, the charioteer in the attitude of driving, so that when the card is twirled round, the charioteer is seen driving the chariot.

THAUMATUR'GIC, or **THAUMATUR'GICAL**, *a.* [See **THAUMATURGY**.] Exciting wonder.

THAUMATUR'GIST, } *n.* One who
THAUMATUR'GUS, } deals in wonders, or believes in them. It is sometimes used by Roman Catholics to signify a miracle-worker; as Gregory *Thaumaturgus*.

THAW, *v. i.* [Sax. *thawan*; G. *thauen*; Dan. *tøer*; Sw. *tåa*; Gr. *ταωω*.] 1. To melt, dissolve, or become fluid, as ice or snow. [It is remarkable that this word is used only of things that congeal by frost. We never say, to *thaw* metal of any kind.]—2. To become so warm as to melt ice and snow; *used of weather*.

THAW, *v. t.* To melt; to dissolve; as ice, snow, hail, or frozen earth.

THAW'ING, *ppr.* Dissolving; resolving into a fluid; liquefying; as, any thing frozen.

THE, *an adjective, or definitive adjective.* [Sax. *the*; D. *de*. Qu. Ch. s7, da.] 1. This adjective is used as a definitive, that is, before nouns which are specific or understood; or it is used to limit their signification to a specific thing or things, or to describe them; as, the laws of the twelve tables. *The* independent tribunals of justice in our country, are the security of private rights, and the best bulwark against arbitrary power. *The* sun is the source of light and heat.

This he calls *the* preaching of the cross. *Simeon.*

2. *The* is also used rhetorically before a noun in the singular number, to denote a species by way of distinction; a single thing representing the whole. *The* fig-tree putteth forth her green figs; *the* almond-tree shall flourish;

the grasshopper shall be a burden.—3. In *poetry*, the sometimes loses the final vowel before another vowel.

Th' adorning thee with so much art,
Is but a barbo'rous skill. *Cowley.*

4. *The* is used before adjectives in the comparative and superlative degree. *The longer* we continue in sin, *the more difficult* it is to reform. *The most strenuous* exertions will be used to emancipate Greece. *The most* we can do is to submit; *the best* we can do; *the worst* that can happen. *The* is generally pronounced with the *e* short; but when used emphatically, it is pronounced as *thee*.

THE'A, *n.* [See TEA.] A genus of plants, nat. order Ternstroemiaceæ, which includes the plants yielding the tea of commerce. The species are few, at most three, *T. viridis*, *T. bohea*, and *T. assamica*, and some botanists assert that even these are varieties of a single species. *T. viridis* is a large,

Tea viridis.

hardy, evergreen plant, with spreading branches, its leaves three to five inches long, thin, very broadly lanceolate, light green and wavy, with large and irregular serratures, the flowers large, usually solitary, and of a white colour. It is found both in China and Japan. *T. bohea* is a smaller plant than *T. viridis*, and differs from it in several particulars. From either species, however, by means of a different process of manipulation in the manufacture, both black and green tea are produced. Tea is cultivated in China over a great extent of territory; it is also extensively cultivated in Japan, Tonquin, Cochinchina, and Assam. In China, the climate most congenial to it seems to be that between the 27th and 31st degree of north latitude. In the husbandry of China, the tea-plant may be said to take the same place which the vine occupies in the southern countries of Europe. Its growth is chiefly confined to hilly tracts, not suited to the growth of corn, and the rearing of it requires great skill and attention, as well as the preparation of the leaves. [See TEA.]

THEAN'DRIC, *a.* [Gr. *θεός*, God, and *άνθρωπος*, a man.] Designating the union of divine and human operation in Christ, or the joint agency of the divine and human nature.

THEAN'THROPISM, *n.* [Gr. *θεός*, and *άνθρωπος*.] A state of being God and man.

THE'ARCHY, *n.* [Gr. *θεός*, God, and *αρχή*, rule.] Government by God; more commonly called *Theocracy*.

THE'ATINS, } *n.* An order of monks
TE'ATINS, } founded at Rome in

1524, principally by Gianpietro Caraffa, archbishop of Chieti in Naples, the Latin name of which is *Teate*, hence the name given to the order. Besides taking the usual monastic vows, they bound themselves to preach against heretics, to take upon them the cure of souls, to attend the sick and criminals, to abstain from possessing property, and not even to ask for alms, but to trust to Providence for support, expecting, however, that this support would be derived from the voluntary alms of the charitable. There were also Theatin nuns (called in French *Theatines*) who spent their whole time in solitude and prayer. The Theatins were principally established in Italy and France, in which latter country they subsisted till the revolution in 1789. In Italy the order is still numerous and influential.

THE'ATRAL,† *a.* Belonging to a theatre.

THE'ATRE, *n.* [Fr. *theatre*; L. *theatrum*; Gr. *θεατρον*, from *θεωωμαι*, to see.]

1. Among the ancients, an edifice in which spectacles or shows and dramatic representations were exhibited for the amusement of spectators. Among the Greeks and Romans, theatres were the chief public edifices next to the temples, and in point of magnitude they surpassed the most spacious of the temples. The Greek and Roman theatres very closely resemble each other in their general form and principal parts. The building was of an oblong, semicircular form, resembling the half of an amphitheatre. The space appropriated to the seats of the spectators was termed *cavea* by the Romans, and *κολων* by the Greeks. The seats were all concentric with the orchestra, and were intersected in one direction by ascents or flights of steps, dividing the seats into so many compartments. The place for the players, in front of the seats, was called *scena* (*σκηνη*). The semicircular space between the *scena* and the seats of the spectators was called *orchestra* (*ορχηστρα*), appropriated by the Greeks to the chorus and musicians, and by the Romans to the senators. Besides these essential parts there were the *pulpitum* or stage, the *proscenium*, and *postscenium*, with regard to which parts the Greek and Roman theatres differed considerably.—2. In *modern times*, a house for the exhibition of dramatic performances, as tragedies, comedies, and farces; a playhouse; comprehending the stage, the pit, the boxes, galleries, and orchestra.—3. Among the *Italians*, an assemblage of buildings, which by a happy disposition and elevation, represents an agreeable scene to the eye.—4. A place rising by steps or gradations like the seats of a theatre.

Shade above shade, a woody theatre

THE'CA, *n.* [L. from Gr. *θηκη*.] A sheath or hollow case. In *bot.*, the term *thecæ* is used to indicate the reproductive organs of ferns, or those minute capsules, which are aggregated into little masses called *sori*. In the Equisetaceæ it expresses the assemblage of cases which are attached to scales arranged in a conical manner; in Lycopodiaceæ, it is used to indicate the kidney-shaped two-valved cases that contain the reproductive matter; and in mosses, it expresses the organs that enclose the sporules.—2. In *anat.*, *thecæ* is applied to the strong fibrous sheaths in which certain soft parts of the body are enclosed; as the canal of the vertebral column, and the canals in which many of the long tendons of the muscles of the hand and foot run.

THE'CAPHORE, *n.* [Gr. *θηκη*, a case or cover, and *φορεω*, to bear or carry.] In *bot.*, the roundish stalk upon which the ovary of some plants is elevated; as in the caper bush. It is also called podogynium and gynophore.

THEE,† *v. i.* [Goth. *thihan*; Sax. *thean*.] To thrive; to prosper.

THEFT, *n.* [Sax. *thyfthe*. See *THIEF*.] 1. The act of stealing. In *jurisprudence*, the general name for the most ordinary class of offences against property, for which English law uses the term larceny. Simple larceny, or theft, is committed by wrongfully taking, against the will of the owner, and carrying away the goods of another, with the fraudulent and felonious intent wholly to deprive him of his property therein. Hence it requires an actual taking, and an actual carrying away for some distance, to constitute the

offence. Compound larceny, or theft, is when the theft is accompanied by aggravating circumstances; as, when it is committed upon the person, or consists in stealing from a dwelling house. Taking from the person in a violent manner is *robbery*, and stealing in a dwelling house after having broken therein is *burglary*. [See LARCENY.] In *Scots law*, theft is defined, "the intentional and clandestine taking away of the property of another, from its legitimate place of deposit, or other *locus tenendi*, with the knowledge that it is another's, and the belief that he would not consent to its abstraction; and with the intention of never restoring it to the owner." This distinction between the *infang thief*, or one taken while yet in sight, and the *oudfang thief*, is now done away. But a distinction is still made between trifling theft or *pickery*, which is punishable with corporal punishment, imprisonment in bridewell, or fine, and theft properly so called. Simple theft is not punishable capitally unless of an aggravated character; as, theft under trust, when of a black description; the stealing of the larger animals, sheep included; theft to a great extent; theft by one habit and reputed a thief; theft by breaking lockfast places, or by housebreaking.—2. The thing stolen; Exod. xxii.

THEFT-BOTE, *n.* [theft and Sax. *bote*, compensation.] In *law*, the receiving of a man's goods again from a thief; or a compensation for them, by way of composition, and to prevent the prosecution of the thief. This subjects a person to fine and imprisonment, as by this means the punishment of the criminal is prevented.

THE'FORM, *a.* Having the form of tea.
THE'INE, *n.* [from *thea*, the generic name of the tea-plant.] A bitter crystallizable principle found in tea, and also in coffee, and some other plants. It forms fine white prisms of a silky lustre, which are soluble in water, alcohol, and ether, bitter, fusible, and volatile. It is considered to be the principle which gives to tea its refreshing and gently stimulating qualities, and is composed of 8 atoms carbon, 2 nitrogen, 5 hydrogen, and 2 oxygen. [See CAFFEINE.]

THEIR, *a. pronom.* [Sax. *hiora*; Ice. *theirra*.] 1. *Their* has the sense of a pronominal adjective, denoting of them, or the possession of two or more; as, *their voices*; *their garments*; *their houses*; *their land*; *their country*.—2. *Theirs* is used as a substitute for the adjective and the noun to which it refers, and in this case it may be the nominative to a verb. "Our land is the most extensive, but *theirs* is the best cultivated." Here *theirs* stands as the representative of *their land*, and is the nominative to *is*.

Nothing but the name of zeal appears, "Twixt our best actions and the worst of *theirs*." Denham.

In this use, *theirs* is not in the possessive case, for then there would be a double possessive.

THE'ISM, *n.* [from Gr. *θεος*, God.] The belief or acknowledgment of the existence of a God, as opposed to *atheism*. *Theism* differs from *deism*, for although *deism* implies a belief in the existence of a God, yet it signifies in modern usage a denial of revelation, which *theism* does not.

11.

THE'IST, *n.* One who believes in the existence of a God.

THEIST'IC, } *a.* Pertaining to
THEIST'ICAL, } theism, or to a
theist; according to the doctrine of
theists.

THELPHU'SIANS, *n.* The name given by Milne Edwards to a tribe of brachyurous crustaceans, forming the passage between the cancerians and the land crabs. All the known species live in the earth near the banks of rivers, or in humid forests, bearing a strong analogy to the land crabs.

THEM, *pron.* the objective case of *They*, and of both genders. [In our mother tongue, *them* is an adjective, answering to *the*, in the dative and ablative cases of both numbers. The common people continue to use it in the plural number as an adjective, for they say, bring *them* horses, or *them* horses are to be led to water.]

Go ye to *them* that sell, and buy for yourselves; Matth. xxv.

Then shall the king say to *them* on his right hand, Come, ye blessed of my Father; Matth. xxv.

THEME, *n.* [L. *thema*; Gr. *θεμα*, from *τιθημι*, to set or place.] 1. A subject or topic on which a person writes or speaks; any thing proposed as a subject of discourse or discussion; a position or proposition. The preacher takes a text for the *theme* of his discourse.

When a soldier was the *theme*, my name Was not far off. Shak.

2. A short dissertation composed by a student on a given subject.—3. In *gram.*, a radical verb, or the verb in its primary absolute sense, not modified by inflections; as, the infinitive mode in English. But a large portion of the words called *themes* in Greek, are not the radical words, but are themselves derivative forms of the verb. The fact is the same in other languages.—4. In *music*, a series of notes selected as the text or subject of a new composition.

THE'MIS, *n.* [Gr.] In *Græcian myth.*, the goddess of law and order.

THEMSELVES, a compound of *them* and *selves*, and added to *they* by way of emphasis or pointed distinction. Thus we say, *they themselves* have done the mischief; they cannot blame others. In this case, *themselves* is in the nominative case, and may be considered as an emphatical pronoun. In some cases, *themselves* is used without *they*, and stands as the only nominative to the following verb. *Themselves* have done the mischief. This word is used also in the objective case after a verb or preposition. Things in *themselves* innocent, may under certain circumstances cease to be so.

They open to *themselves* at length the way. Milton.

THEN, *adv.* [Goth. *thanne*; Sax. *thane*; G. *dann*; D. *dan*. See **THENCE**.] 1. At that time, referring to a time specified, either past or future.

Till *then* who knew

The force of those dire arms? Milton. *Then* is often used elliptically for the *then existing*; as, the *then* administration.

THE'N'ARDITE, *n.* Anhydrous sulphate of soda. It occurs in crystalline coatings at the bottom of some lakes about five leagues from Madrid. It is used in the preparation of carbonate of soda.

THE'N'ARD'S BLUE, *n.* Cobalt blue; a blue pigment prepared by digesting oxide of cobalt with nitric acid, and adding phosphate of soda, by which phosphate of cobalt is formed. This is mixed with gelatinous alumina, and the paste so formed is dried, and subjected to a cherry red heat, by which means the pigment is produced. [See COBALT.]

THENCE, *adv.* (thens.) [Sax. *thanan*, *thanon*; G. *dannen*; from *than*, *dann*, *then*, supra. *Then* signifies properly place, or set time, from *setting*, and *thence* is derived from it. So the Germans say, *von dannen*, from *thence*.]

1. From that place.

When you depart *thence*, shake off the dust of your feet; Mark vi.

It is more usual, though not necessary, to use *from* before *thence*.

Then will I send and fetch *them* from *thence*; Gen. xxvii.

2. From that time.

There shall be no more *thence* an infant of days; Is. lxv.

3. For that reason.

Not to sit idle with so great a gift Useless, and *thence* ridiculous about him. Milton.

THENCEFORTH, *adv.* (thens'forth.) [*thence* and *forth*.] From that time.

If the salt hath lost its savor, it is *thenceforth* good for nothing; Matth. v.

This is also preceded by *from*, though not from any necessity.

And from *thenceforth* Pilate sought to release him; John xix.

THENCEFOR'WARD, *adv.* [*thence* and *forward*.] From that time onward.

THENCEFROM,† *adv.* [*thence* and *from*.] From that place.

THEOBROMA, *n.* A genus of plants, nat. order Sterculiaceæ, the species of which yield the cacao, or cocoa, of commerce. They are trees with large simple leaves, and with the flowers in clusters, and are all of them natives of South America. The most important species is the *T. cacao*, the common cacao, or chocolate nut tree, which is indigenous in South America, but is extensively cultivated in the West Indies, and in the tropical parts of Asia and Africa. The capsules of the fruit are large, and contain each about 25 seeds; the pulp in which these are enveloped, has a sweet and not unpleasant taste, and is eaten by the natives. The cotyledons of the seeds contain a large quantity of oily albumen, which has an agreeable flavour, and on this account they are not only used as a principal article of diet by the natives of the countries in which they grow, but are now used for the

6 K

same purpose throughout the civilized world. The oil contained in the seeds is sometimes obtained separately, and called *cacao butter*. The seeds, reduced to a paste, and flavoured with honey, sugar, and certain other ingredients, constitute chocolate. [See CACAO.]

THEOBROMINE, *n.* A crystalline compound found in the seeds of *Theobroma cacao*. In composition it is analogous to theine or caffeine.

Of this species the Israelites furnish an illustrious example. The *theocracy* lasted till the time of Saul.

THEODICY, } *δικαιωσις*, just.] A vindication of the dealings of Divine Providence with man; the title of a work published by Leibnitz in 1710, in which the doctrine of Optimism is maintained.

THEODOLITE, *n.* [Qu. Gr. *θεωρομαι*, to view, and *δολος*, stratagem.] A most important surveying instrument for measuring horizontal angles, or the angular distances between objects projected on the plane of the horizon. This instrument is variously constructed, and provided with subordinate apparatus, according to the price, or the particular purposes to which it is to be applied. One of the most generally useful, consists of two concentric horizontal circular plates A and B, which turn freely on each other.

Theodolite.

The lower or graduated plate B, contains the divisions of the circle, and the

upper or vernier plate has two vernier divisions *a*, diametrically opposite, only one of which is shown in the cut. The vertical axis C, consists of two conical parts, the one working within the other. The external part is attached to the graduated plate B, and the internal to the vernier plate A. The plane of the circle is adjusted to the horizon by the screws *b*, *b*, *b*, acting against a plate of metal resting on the staff-head supporting the instrument. The vernier plate carries two spirit levels *c*, *c*, at right angles to each other, with their proper adjusting screws, by which the circle is brought accurately into the horizontal plane indicated by the levels. The horizontal axis of the vertical limb of the instrument is supported by a frame attached to the vernier plate, and turning along with it about the vertical axis. To the horizontal axis D, a telescope, with cross wires in its focus, is attached, which moves in the vertical plane, by the graduated circle E, and is used for observing the objects whose angular distance is to be measured, and also for taking altitudes, or measuring vertical angles, a spirit level is fixed beneath the telescope for its adjustment. F is a microscope for reading off the vernier divisions. The screws *g*, *h*, are for regulating and fixing the external part of the vertical axis C. To measure the angular distance between any two objects, the telescope is turned round along with the vernier circle, (the graduated circle remaining fixed,) until it is brought to bear exactly upon one of the objects; it is then turned round until it is brought to bear on the other object, and the arc which the vernier has described on the graduated circle, measures the angle required. The observation may be repeated any number of times in order to insure accuracy, by means of a repeating stand which turns round concentrically with the vertical axis of the theodolite. The theodolite is not only a most essential instrument in trigonometrical surveying for determining stations, and running base-lines, but also in geodetical operations, for assisting in determining the length of an arc of the meridian. For this latter purpose it requires to be constructed on a large scale.

THEOL'OGY, *n.* [Fr. *theologie*; It. and Sp. *teologia*; Gr. *θειολογια*: *θεος*, God, and *λογος*, discourse.] Divinity; the science of God and divine things; or the science which teaches the existence, character, and attributes of God, his laws and government, the doctrines we are to believe, and the duties we are to practise. Theology consists of two branches, *natural* and *revealed*. *Natural theology* is the knowledge we have of God from his works, by the light of nature and reason. Such as his existence and unity; that he is possessed of certain perfections, the signatures of which are perceptible upon his works; that he governs the world; that it is our duty to honour and please him, by the practice of piety, justice, and benevolence; that the soul of man is immortal; and that there is a future state, in which the righteous will be rewarded, and the wicked punished. The doctrines and truths, however, which natural theology professes to teach, are, when taken by themselves, unsuitable to the present circumstances of mankind, and altogether inadequate for those purposes for which such knowledge is needed by man. Natural theology holds forth no certain hope of pardon to the guilty, and in the present enfeebled and corrupt state of our moral powers, the duties which it prescribes are absolutely impracticable. Hence, the grand foundation of theology is revelation, to which natural religion is a valuable, but not necessary, auxiliary. *Revealed theology*, or *supernatural theology*, as it is sometimes called, is that which is to be learned only from revelation, or that which is founded entirely upon the canonical books of the Old and New Testament. It is also sometimes called *positive theology*, as being founded upon the expressed will of God. Theology is variously divided, according to the method of treating the subject, and the part of the subject which is treated.—*Popular* or *Biblical theology*, that which is derived from the obvious meaning of the letter of Scripture, without any external aid, having for its fundamental principle that the Scriptures are to be interpreted by each individual reader, according to the ordinary laws by which the meaning of any other book is ascertained. This is the Protestant system, and stands opposed to the Roman Catholic system, or the *positive system* as it is called.—*Systematic theology*, that which reduces the scattered truths of revelation to the scientific form of a connected system; it also comprehends the investigation and discussion of those truths.—*Essegetical*

theology, that which consists in the knowledge of the documents which contain the revelation, the proof of their authority, and the explanation of their meaning.—*Historical theology*, that which exhibits a history of the workings and changes of religion among those who have professed it.—*Practical theology*, that which has for its subject the duties of practical religion, and the various modes of enforcing them. It comprehends *Homiletics*, *Catechetics*, *Liturgics*, and *Pastoral theology*.—*Dogmatic theology*, the science of exhibiting clearly, and of tracing to their results, the doctrines taught by revelation. It aims at forming a system which shall be accepted as binding by a large body of religionists, and then views all religious truth in the light of that system. The term is chiefly employed by German writers.—*Moral theology* teaches us the divine laws relating to our manners and actions, that is, our moral duties.—*Speculative theology* teaches or explains the doctrines of religion, as objects of faith.—*Scholastic theology* is that which proceeds by reasoning, or which derives the knowledge of several divine things from certain established principles of faith.

THEOM'ACHIST, *n.* [Gr. *Θεός*, God, and *μαχη*, combat.] One who fights against the gods.

In *modern history*, the title *theophilanthropist* was assumed by a society formed at Paris during the first French revolution. It had for its object to establish a new religion in place of Christianity, which had been abolished by the convention. The system of belief thus attempted to be established was pure deism, and, as was to be expected, proved a failure.

or *teorbe*.] A musical instrument made like a large lute, except that it has two necks or juga, the second and longer of which sustains the four last rows of chords which are to give the deepest sounds. The theorbo has eight base or thick strings, twice as long as those of the lute, which excess of length renders the sound exceedingly soft, and continues it a great length of time. It was also called the *archlute*, and was used chiefly, if not only, as an accompaniment to the voice. It has long fallen into disuse.

THE'OREM, *n.* [Fr. *theoreme*; Sp. and It. *teorema*; Gr. *θεωρημα*, from *θεωρειν*, to see.] In *math.*, a proposition to be proved by a chain of reasoning; any proposition which states its conclusion or makes any affirmation or negation; as distinguished from a *problem*, which requires a conclusion to be arrived at, without so much as stating whether that conclusion is even possible. A *theorem* wants demonstration only; a *problem* requires solution, or the discovery both of method and demonstration.—2. A speculative truth; a position laid down as an acknowledged truth.—3. In *alge*, or *analysis*, it is sometimes used to denote a rule, particularly when that rule is expressed by symbols or formulae; as, the binomial *theorem*, Taylor's *theorem*, &c.—A *universal theorem* extends to any quantity without restriction.—A *particular theorem* extends only to a particular quantity.—A *negative theorem* expresses the impossibility of any assertion.—A *local theorem* is that which relates to a surface.—A *solid theorem* is that which considers a space terminated by a solid, that is, by any of the three conic sections.

THE'ORY, *n.* [Fr. *theorie*; It. *teoria*;

L. *theoria*; Gr. *θεωρια*, from *θεωρειν*, to see or contemplate.] 1. Speculation; a doctrine or scheme of things, which terminates in speculation or contemplation, without a view to practice. It is here taken in an unfavourable sense, as implying something visionary.—2. An exposition of the general or abstract principles of any science; as, the *theory* of music.—3. The science distinguished from the art; as, the *theory* and practice of medicine.—4. In the *arts*, the rules of an art as distinguished from the practice; or the knowledge of an art, so far as results from speculation on its nature, on the end which it proposes to attain, on the means which it is necessary to employ in order to attain the end proposed, &c., without being occupied with its practice.—5. A collected view of all that is known on any speculative subject; a connected body of truths having a dependence on one another, and belonging to one or more common principles; or it is a connected arrangement of facts, according to their bearing on some real or hypothetical law.—In *physical science*, a theory is defined, "An explanation of natural phenomena, founded on facts known to be true from evidence independent of those phenomena or appearances. Thus, we have the *theory* of gravitation, the *atomic theory*, *theories* of light, *theories* of heat, *theory* of combustion, *lunar theory*, *theory* of dew, *theories* of the earth, &c. A theory is often nothing else but a contrivance for comprehending a certain number of facts under one expression. Many theories are founded entirely on analogy, and such theories may have all degrees of evidence from the least to the greatest. The evidence of a theory increases with the number of facts which it explains, and the precision with which it explains them. It diminishes with the number of facts which it does not explain, and with the number of different suppositions that will afford explanations equally precise. A theory may not deserve to be rejected because it does not explain all the phenomena, if it explains a great number, and be not absolutely inconsistent with any one, but a single fact inconsistent with any theory may be sufficient to overturn it. *Theory* is distinguished from *hypothesis* thus: a theory is founded on inferences drawn from principles which have been established on independent evidence; a hypothesis is a proposition assumed to account for certain phenomena, and has no other evidence of its truth, than that it affords a satisfactory explanation of those phenomena. It is necessary to keep this distinction in view, as the terms *theory* and *hypothesis* are very frequently confounded both in speaking and writing. The terms *theory* and *practice* are also often used in a very loose and inaccurate manner, and are liable to a very common fallacy, namely, that of applying to one sense of a word, ideas or associations derived from another. By *practice*, as distinguished from *theory*, is often meant the application of that knowledge which comes from experience only, and is not sufficiently connected with any general principles to be entitled to the name of a theory; but as there is no theorist whose knowledge is all theory, so there is no practical man whose skill is all derived from experience. [See **Sig. 1**.]

—*Theory of couples*, by couples in *physics* is meant a pair of equal and opposite forces not equilibrating each other, and the explanation or investigation of the phenomena or effects resulting from such forces is termed the *theory of couples*.—*Theory of equations*, that part of algebra which treats of the properties of rational and integral functions of a single variable, its great object being to develop the properties, and to evolve the values of the real and imaginary roots of equations of every degree.—*Theory of numbers*. [See NUMBER.]

THERMOMETER, *n.* [Gr. *θερμ*, warm, from *θερμ*, heat, and *μετρος*, measure.] An instrument for measuring heat, or by which the temperatures of bodies are ascertained; founded on the property which heat possesses of expanding all bodies, the rate or quantity of expansion being supposed proportional to the degree of heat applied, and hence indicating that degree. The thermometer consists of a slender glass tube, with a small bore, containing in general mercury or alcohol, which expanding or contracting by variations in the temperature of the atmosphere, or on the instrument being brought into contact with any other body, or immersed in a liquid or gas, which is to be examined, the state of the atmosphere, the body, liquid, or gas, with regard to heat, is indicated by a scale either applied to the tube, or engraven on its exterior surface. There are several kinds of thermometers, but the one in common use in this country is Fahrenheit's, so called from the name of the inventor. It consists of a small tube, terminating in a ball containing mercury, the air having been expelled, and the tube hermetically sealed. There are two points on the scale, corresponding to fixed and determinate temperatures; the first corresponds to the temperature of freezing water, and is marked 32°, the other corresponds to the temperature of boiling water, and is marked 212°; hence, the zero of the scale, or that point marked 0°, is 32° below the freezing point, and the interval or space between the freezing and boiling points consists of 180°. On the Continent, particularly in France, the centigrade thermometer is used. The space between the freezing and boiling points is divided into 100 equal parts or degrees, the zero being at freezing, and the boiling point at 100°. Reaumur's thermometer, which is in use in Germany, has the space between the freezing and boiling points divided into 80 equal parts, the zero being at freezing. The following formulae, deduced from the manner in which the three scales are divided, will serve to convert any given number of degrees of Fahrenheit's scale into the corresponding number of degrees on Reaumur's, and the centigrade scales, and vice versa: Let F, R, and C, represent any corresponding numbers of degrees on the three scales respectively, then; $(F - 32°) \times \frac{4}{9} = R$, and $(F - 32°) \times \frac{5}{9} = C$; $\frac{9}{5} \times R + 32° = F$, and $\frac{9}{5} \times C + 32 = F$; Also, $\frac{4}{5} \times C = R$, and $\frac{5}{4} \times R = C$. For extreme degrees of cold, thermometers filled with spirit of wine must be employed, as no degree of cold known is capable of freezing that liquid, whereas mercury freezes at about 39° below zero. On the other hand, spirit of wine is not adapted to high temperatures, as it is soon converted into vapour, whereas mercury

does not boil till its temperature is raised to 660°. Of all fluids, mercury is the best adapted for thermometers employed for indicating all ordinary temperatures.—*Register thermometer*. [See REGISTER.]—*Differential thermometer*. [See DIFFERENTIAL.] The thermometer indicates only the *sensible* heat of bodies, and gives us no information respecting the quantity of latent heat, or of combined heat, which those bodies may contain.

THERMOMETRIC, *a.* Pertaining to a thermometer; as, the *thermometrical* scale or tube.—2. Made by a thermometer; as, *thermometrical* observations.

The same name was at first given to Leslie's differential thermometer.

THERMOSCOPIC, *a.* Pertaining to the thermoscope.

THERMOSTAT, *n.* [*θερμ*, and *στατος*, standing.] An apparatus contrived by Dr. Ure, for regulating temperature in the processes of distillation and vaporization, in baths, hot houses, in adjusting the heat of stoves and furnaces, &c. It operates upon the principle that when two thin metallic bars of different degrees of expansibility are riveted or soldered face ways together, any change of temperature will cause the compound bar to bend, the side on which the least expansible bar is becoming concave, and the other convex. These flexures are made to operate in regulating valves, stop-cocks, stove registers, &c., and thereby to regulate the flow of heated liquids, or the admission or emission of air.

THERMOSTATIC, *a.* Pertaining to the thermostat.

THERMOTENSION, *n.* [Gr. *θερμ*, hot, and *Λ. tensio*, a stretching.] *Literally*, a stretching by heat. This word is applied by Professor Johnson to a process of increasing the direct cohesion of wrought iron. It consists in heating the metal to a determinate temperature, generally from 500° to 600°, of Fahrenheit, and in that state giving to it, by appropriate machinery, a mechanical strain or tension, in the direction in which the strain is afterwards to be exerted. The degree of tensile force applied is determined beforehand by trials on the same quality of metal at the ordinary temperature, in order to ascertain what force would, in that case, have been sufficient to break the piece which is to be submitted to thermotension.

THINE, pronominal adj. [Goth. *theins*, *theina*; Sax. *thin*; G. *dein*; Fr. *tien*; probably contracted from *thigen*. See **THOU**.] Thy; belonging to thee; relating to thee; being the property of thee. It was formerly used for *thy*, before a vowel.

Then thou mightest eat grapes *thy* fill, at *thine* own pleasure; Deut. xxxii.

But in common usage, *thy* is now used before a vowel in all cases. The principal use of *thine* now is when a verb is interposed between this word and the noun to which it refers. I will not take any thing that is *thine*. *Thine* is the kingdom, and the glory. In the following passage *thine* is used as a substitute for *thy righteousness*.

I will make mention of *thy righteousness*, even of *thine* only; Ps. lxxi.

In some cases it is preceded by the sign of the possessive case, like nouns, and is then also to be considered as a substitute.

If any of *thine* be driven out to the utmost parts of heaven; Deut. xxx.

It is to be observed that *thine*, like *thou*, is used only in the solemn style. In familiar and common language, *your* and *yours* are always used in the singular number as well as the plural.

THING, n. [Sax. *thing*, a thing, a cause; for his *thingon*, for his cause or sake; also, *thing* and *gething*, a meeting, council or convention; *thingan*, *thingian*, to hold a meeting, to plead, to supplicate; *thingere*, an intercessor; *thingung*, intercession; G. *ding*, a thing, a court; *dingen*, to go to law, to hire or haggle; *Dingstag*, Tuesday, [*thing's day*]; *beding*, condition, clause; *bedingen*, to agree, to bargain or contract, to cheapen; D. *ding*, thing, business; *dingen*, to plead, to attempt, to cheapen; *dingbank*, the bar; *dingdagen*, session-days; *dingen*, *dingster*, a pleader; *dingtaal*, plea; *Dingsdag*, Tuesday; *beding*, condition, agreement; *bedingen*, to condition; Sw. *ting*, thing, cause, also a court, assizes; *tinga*, to hire, bargain, or agree; Dan. *ting*, a thing, affair, business, case, a court of justice; *tinger*, to strike up a bargain, to haggle; *tingbog*, records of a court, [*thing-book*]; *tingdag*, the court day, the assizes; *tinghold*, jurisdiction; *tingmænd*, jurors, jury, [*thing-men*]; *tingsag*, a cause or suit at law, [*thing-sake*]. The primary sense of *thing* is that which comes, falls, or happens, like *event*, from L. *evento*. The primary sense of the root, which is *tig* or *thig*, is to press, urge, drive, or strain, and hence its application to courts, or suits at law; a seeking of right. We observe that *Dingsdag*, *Dingdag*, in some of the dialects

signifies *Tuesday*, and this from the circumstance that that day of the week was, as it still is in some states, the day of opening courts; that is, *litigation day*, or *suitors' day*, a day of striving for justice; or perhaps *combat-day*, the day of trial by battle. This leads to the unfolding of another fact. Among our ancestors, *Tig* or *Tiig*, was the name of the deity of combat and war, the Teutonic Mars; that is, strife, combat deified. This word was contracted into *tio* or *tu*, and hence *Tivesdag* or *Tuesdag*, Tuesday, the day consecrated to *Tiig*, the god of war. But it seems this is merely the day of commencing court and trial; *litigation day*. This *Tiig*, the god of war, is *strife*, and this leads us to the root of *thing*, which is to drive, urge, strive. *So res*, in Latin, is connected with *res*, accused. For words of like signification, see **SAKE** and **CAUSE**.] 1. An event or action; that which happens or falls out, or that which is done, told, or proposed. [*See THIRL.*] In *Scots law*, a species of servitude, formerly very common in Scotland, and also prevalent in England, by which the proprietors or other possessors of lands were bound to carry the grain produced on the lands to a particular mill to be ground, to which mill the lands were said to be *thirled* or *stricted*, and also to pay a certain proportion of the grain, varying in different cases, as a remuneration for the grinding, and for the expense of the erection and maintenance of the mill. The principal duty chargeable in thirlage was *multure*, which consisted of a proportion varying from about $\frac{1}{16}$ to about $\frac{1}{2}$ of the grain carried, or of the meal or flour ground, deliverable to the miller or other possessor of the mill under the proprietor, or to the proprietor or superior himself. There were also smaller duties of *knaveship*, *bannock*, *lock* and *gowpen*, called *sequals*, [*see these terms.*] which fell to the servants of the mill, according to the particular usage of each mill. This kind of servitude having become, in many cases, exceedingly oppressive, has fallen into disuse, an annual payment in grain or in money being substituted for it.

THIRST, n. (thurst.) [*Sax. thurst*, *thyrst*; G. *durst*; Dan. *törst*, from *tör*, dry; *törrest*, to dry, L. *torreo*, Sw. *torha*.]

1. A painful sensation of the throat or fauces, occasioned by the want of drink. Water is the proper object of this sensation or desire, although man, owing to disposition or his artificial mode of life, often satisfies it with other liquids. By satisfying thirst the body is provided with the quantity of water necessary for the repair of its tissues, and the maintenance of their proper moisture, and for the replacement of the fluid constantly lost by perspiration and other discharges. If

thirst be long unallayed it produces one of the most dreadful states which man can be compelled to endure. Thirst is a common symptom of febrile and other diseases.

Wherefore is it that thou hast brought us out of Egypt, to kill us and our children and our cattle with *thirst*? Exod. xvii.

2. A vehement desire of drink; Ps. civ.—3. A want and eager desire after any thing.

Of porous earth with kindly *thirst* uprawn,
Rose a fresh fountain. Milton.

THIS, *definitive adjective*, or *substitute*.

ii.

plur. *These*. [Sax. *this*; Dan. plur. *dise*; G. *das, dessen*; D. *deez*, *dit*.]

1. *This* is a definitive, or a definitive adjective, denoting something that is present or near in place or time, or something just mentioned. Is *this* your younger brother? What trespass is *this* which ye have committed?

Who did sin, *this* man or his parents, that he was born blind? John ix.

When they heard *this*, they were pricked to the heart; Acts ii.

In the latter passage, *this* is a substitute for what had preceded, viz., the discourse of Peter just delivered. In like manner, *this* often represents a word, a sentence, or clause, or a series of sentences or events. In some cases, it refers to what is future, or to be immediately related.

But know *this*, that if the good man of the house had known in what watch the thief would come, he would have watched, and would not have suffered his house to be broken up; Matt. xxiv.

Here *this* refers to the whole subsequent member of the sentence.—2. *By this*, is used elliptically for *by this time*; as, *by this* the mail has arrived.—

3. *This* is used with words denoting time past; as, I have taken no snuff for *this* month; and often with plural words. I have not wept *this* forty years. In this case, *this*, in the singular, refers to the whole term of time, or period; *this period* of forty years.—

4. *This* is opposed to *that*.

This way and *that* the wav'ring sails they bend. Pope.

A body of *this* or *that* denomination is produced. Boyle.

This and *that*, in this use, denote difference indefinitely.—5. When *this* and *that* refer to different things before expressed, *this* refers to the thing last mentioned, and *that* to the thing first mentioned. [See THESE.]

Their judgment in *this* we may not, and in *that* we need not, follow. Hooker.

6. *This* is sometimes opposed to *other*.

Consider the arguments which the author had to write *this*, or to design the *other*, before you arraign him. Dryden.

THISTLE, n. (this'l.) [Sax. *thistel*; G. and D. *distel*; Sw. *tistel*.] The common name of prickly plants of the genus *Carduus*, a genus belonging to the class Syngenesia, and order Polygamia equalis, Linn.; nat. order Compositæ. It consists of upwards of 30 species, most of which are inhabitants of Europe; as the musk thistle (*C. nutans*); milk thistle (*C. marianus*); walted thistle (*C. acanthoides*); slender-flowered thistle (*C. tenuiflorus*).

The name thistle is also given to numerous prickly plants belonging to other genera; as the spear-thistle (*Cnicus lanceolatus*); field thistle (*Cnicus arvensis*), a well-known plant, very troublesome to the farmer. The cotton thistle belongs to the genus *Onopordum*; the common cotton-thistle (*O. acanthum*) attains a height of from four to six feet. It is cultivated in Scotland as the Scotch thistle, but it is doubtful whether the thistle which constitutes the national badge has any existing type. The carline thistle belongs to the genus *Carlina*; the blessed thistle is the *Centaurea benedicta*; and the star-thistle is the *Centaurea calcitrapa*.

The sow-thistle belongs to the genus *Sonchus*, and the globe-thistle to the genus

Echinops. Some species of the thistle are admitted into gardens, where they form a pretty variety for borders. Thistles sow themselves extensively by means of their winged seeds, and hence they are great pests to the farmer.—*Order of the Thistle*, an ancient Scottish order of knighthood, sometimes called the order of St. Andrew. The date of its institution is not known, but it was revived by James V. of Scotland in 1540, again by James VII. of Scotland and II. of England in 1687, and a third time in 1703 by Queen Anne, who increased the number of knights to twelve, and placed the order on a permanent footing. In 1827, the number of knights was permanently extended to sixteen. The decorations of the order consist of a collar of enamelled gold, composed of sixteen thistles, interlaced with sprigs of rue, fastened to the mantle by a white riband; a small golden image of St. Andrew suspended from the collar; a gold medal having an image of St. Andrew within a circle, containing the motto of the order, "*Nemo me impune lacessit*," (no one provokes me with impunity); a thistle; a green riband to which the medal is attached, and a star which is worn on the left shoulder. The thistle, as is well known, is the national emblem of Scotland, and the national motto is the same as that of the order of the thistle.

with chlorine, sulphur, and phosphorus.
Hydrochloric acid readily dissolves it,
with the evolution of hydrogen gas.

sometimes incorrectly applied to a
bush with prickles; as, a rose on a
thorn.—2. A sharp ligneous or woody
shoot from the stem of a tree or shrub;
a sharp process from the woody part
of a plant; an abortive or imperfectly
developed twig, which has assumed a
hard texture and terminates in a sharp
point. *Thorns* or *spines* must not be
confounded with *prickles*; the former
are continuous with the woody tissue
of the plant, while the latter are
merely attached to the surface of the
bark. Thorns are in fact modified
branches or leaves, while prickles are
indurated hairs. In common usage,
thorn is applied to the prickle of the
rose, and in fact the two words are
used promiscuously.—3. Any thing

In our language it occurs now only in names of places and persons.

The second personal pronoun, in the singular number; the pronoun which is used in addressing persons in the solemn style.

THOUGHT, *pret.* and *pp.* of *Think*; pronounced *thaut*.

THOUGHT, *n.* (thaut.) [primarily the passive participle of *think*, supra; Sax. *theaht*.] 1. Properly, that which the mind thinks. Thought is either the act or operation of the mind, when attending to a particular subject or thing, or it is the idea consequent on that operation. We say, a man's *thoughts* are employed on government, on religion, on trade, or arts, or his *thoughts* are employed on his dress or his means of living. By this we mean that the mind is directed to that particular subject or object; that is, according to the literal import of the verb *think*, the mind, the intellectual part of man, is set upon such an object, it holds it in view or contemplation, or it extends to it, it stretches to it.

Thought cannot be superadded to matter, so as in any sense to render it true that matter can become cogitative. *Dwight.*

THRASH'ING, *n.* The operation by which grain is separated from the straw. This operation is performed in various ways; as, by the feet of animals, by a flail, or by a thrashing-machine. The first mode was that employed in the ages of antiquity, and it is still practised in the south of Europe, and in Persia and India. Oxen were generally employed for this purpose, either alone or with the addition of a kind of roller studded with iron knots, which the oxen dragged over the corn sheaves, which latter were spread on a circular floor in the form of a circle, the ends containing the grain being placed towards the centre.

Thrashing by the flail is still practised in various parts of this and other countries, but thrashing machines have been very extensively introduced, which effect a great saving in time and labour to the farmer.—2. A sound drubbing.

THRASH'ING-FLOOR, *n.* [*thrash* and *floor*.] A floor or area on which grain is beaten out. In eastern countries, from the earliest ages, thrashing-floors were in the open air; but in colder and moister climates, such as ours, such floors must be under cover. Accordingly, a thrashing-floor with us is a space in a barn-floor, on which the grain is thrashed out by the flail.

THRASH'ING-MACHINE, } *n.* A ma-

THRASH'ING-MILL, } chine for separating grain, as wheat, oats, barley, &c., from the straw; and in which the moving power is that of horses, oxen, wind, water, or steam. Water and horses are most generally employed. The thrashing-machine was invented in Scotland in 1758, by Michael Stirling, a farmer in Perthshire; it was afterwards improved by Mr. Andrew Meikle, a millwright in East Lothian, about the year 1785. Since that time it has undergone various other improvements. The thrashing-machines mostly employed at farm-houses may be briefly described as consisting of three rotative drums or cylinders, which receive motion from a water-wheel, or from a horizontal wheel driven by horses, or by steam power. The first drum which comes into operation has projecting ribs called beaters on its outer surface, parallel to its axis. This drum receives a very rapid motion on its

axis. The sheaves of corn are first spread out on a slanting table, and are then drawn in between two rollers called *feeding* rollers. The beaters of the drum act on the straw as it passes through the rollers, and beat out the grain. The thrashed corn is then carried forward to two successive drums or *shakers*, which, being armed with numerous spikes, lift up and shake the straw so as to free it entirely from the loose grain lodged in it. The grain is made to pass through a grated floor, and is generally conducted to a winnowing machine, which is driven by the same power which drives the thrashing-machine itself, by which means the grain is separated from the chaff. Thrashing-machines effect a great saving in labour; they do the work speedily, and at the time required; and they do the work better than the flail, separating the corn (particularly wheat) more completely from the straw.

In *English criminal law*, threats of personal violence, or any other threats by which a man of ordinary firmness may be put in fear, and by means of which money or other property is extorted from him, amount to the crime of robbery. It is also a misdemeanor at common law to threaten another in order to deter him from doing some lawful act, or to compel him to do some unlawful one, or to extort money or goods from him, or to obtain any other benefit to the person who makes the threat. In *Scots law*, threats, when used so as to infer just ground of fear, or even if less violent, when accompanied with importunity, will void a deed granted by any person while under the influence; and using threats of death to any person, or attempting or pretending to carry them into execution, in order to compel a confession of a real or supposed crime, is punishable at common law. They resemble the shrikes, but they are more frugivorous, generally feeding upon berries, though they prefer small animals, especially molluscs and worms, when these can be obtained. Their habits are mostly solitary, but several species are gregarious in winter. Thrushes have been celebrated from very remote antiquity on account of their powers of song; they are widely diffused, being found in all the quarters of the globe. Among European thrushes we have the blackbird (*Merula vulgaris*), the black-throated thrush (*Turdus atrogularis*), the missel thrush (*Turdus viscivorus*), the field-fare (*Turdus pilaris*), the song thrush or throistle (*Turdus musicus*), the water-ouzel (*Cinclus aquaticus*), the rock-thrush (*Petrocincla saxatilis*), &c. *Turdus erythrogaster* belongs to Asia; *Turdus striptans*, to Africa; and *Turdus melodus*, or the wood thrush, to America.—2. Note.—*Push and shove* do not exactly express the sense of *thrust*. The two former imply the application of force by one body already in contact with the body to be impelled. *Thrust*, on the contrary, often implies the impulse or application of force by a moving body, a body in motion before it reaches the body to be impelled. The existence of this association was scarcely known to the British government before the year 1810, and no combined measures were taken to put it down until about 1830. The Thugs are considered to be a degenerate sect of Káli worshippers, and are peculiarly superstitious in their observances. To rob and murder is with them a sacred duty, and they are directed in all their proceedings by auguries, supposed to be vouchsafed by their tutelary goddess Behovane. They usually move in gangs, consisting of from ten to two hundred or three hundred men, of all races, castes, sects, and religions, yet all joining in the worship of Káli, and sacrificing to their tutelary goddess every victim they can seize, and sharing the plunder among themselves. Still they shed no blood unless when forced by circumstances, but strangle their victims by means of a rope or handkerchief. Particular classes, however, are altogether exempt from their attacks; among whom are dancing girls, minstrels, sikhs, some religious mendicants, tailors, oilmen, blacksmiths and carpenters. In 1830 vigorous measures were adopted for their suppression, and between 1830 and 1837 upwards of 3000 were brought to justice. In consequence of these measures, the numbers of Thugs have rapidly diminished, and it is to be hoped that they will soon be totally extinct. The system practised by the Thugs is termed *Thugee*.

The sound which follows an explosion of electricity or lightning; the report of a discharge of electrical fluid, that is, of its passage from one cloud to another, or from a cloud to the earth, or from the earth to a cloud.—*Thunder* is not lightning, but the effect of it. The character of the sound of thunder varies with the force and the distance of the explosion, the situation of the observer, the nature of the surrounding country, and it is no doubt affected also by the relative situations of the clouds. In general, it is considered that lightning, by its heat, creates a partial vacuum in the atmosphere, and that the sudden rushing of air into the void space produces the sound; but this explanation will not account for the prolongation of the sound. The true cause seems to be the vibration of the air, agitated to a greater or less extent by the passage of the electric fluid with a greater or less degree of intensity. When lightning strikes an object near us in the earth, it produces a noise resembling that of a violent crash, which is not repeated or prolonged by reflection. When the explosion is more distant, a rumbling, irregular, and recurring noise is heard, which gradually dies away in the distance. Thunder frequently commences with a loud rattle, which may be occasioned by a series of discharges of electric matter in rapid succession, from a highly charged thunder cloud. The distance of a thunder cloud may be ascertained by counting the number of seconds which elapse between the time of seeing the flash, and that of hearing the report, and multiplying 1130 feet by that number of seconds, (1130 feet being the distance which sound travels per second); the result will be the distance of the cloud in feet. When the flash and the sound occur almost simultaneously, the thunder cloud is very near; but when 2 or 3 seconds elapse between the time of seeing the former and that of hearing the latter, the cloud may be considered at a safe distance. In thunder storms the lightning frequently does great mischief, destroying trees, killing men and animals, and even shattering buildings. During a thunder storm, persons should avoid going near any object or thing which acts as a conductor to the fluid; such as trees, hedges, water, fire places, gilt furniture, bell wires, and all large metallic surfaces. In a house, the safest place is in the middle of a room, and the security may be increased by sitting or lying upon a feather bed, a hair mattress, or thick woollen rug. Cellars are dangerous, as the discharge is often from the earth to a cloud, and buildings frequently sustain the greatest damage from lightning in the basement story. Thunder can scarcely ever be heard at the distance of more than 20 or 30 miles from the flash which produces it.

There were *thunders* and lightnings; Exod. xix.

2. Thunder is used for lightning, or for a *thunderbolt*, either originally through ignorance, or by way of metaphor, or

Extensive buildings, or those which have several pinnacles rising from their tops, require several rods for their protection, as it is found that the influence of a single rod is limited by the circumference of a circle described about the rod, with a radius equal to twice its height above the top of the building. Ships are protected from the effects of lightning by rods in the same manner as buildings. Thunder rods are also termed *conductors*, because they serve to conduct the electric fluid or lightning which strikes them safely and rapidly to the ground, and do not allow it to fall upon any part of the building.

Such storms are common in tropical regions, and often cause great damage. This violence of the wind seldom continues longer than a few minutes, and after it subsides, the rain continues, but the peals of thunder are less frequent. These violent showers sometimes continue for hours; more generally, they are of shorter duration.

The common or garden thyme, (*T. vulgaris*) has long been a favourite plant on account of its strong, pungent, aromatic odour and taste, and many varieties of it are cultivated in gardens. It is a native of the south-west parts of Europe, and is employed for culinary purposes. It yields an essential oil, which is extremely acrid and pungent. Wild thyme or mother of thyme, (*T. serpyllum*), grows in Britain on hills and in dry pastures, and has the same sensible properties as the garden thyme. [This sense is obsolete.]

2. The alternate rising and falling of the waters of the ocean, and of bays, rivers, &c., connected therewith. The tide appears as a general wave of water, which gradually elevates itself to a certain height, then as gradually

sinks till its surface is about as much below the medium level as it was before above it. From that time the wave again begins to rise; and this reciprocating motion of the waters continues constantly, with certain variations in the height, and in the times of attaining the greatest degree of height and of depression. The alternate rising and falling of the tide wave are observed to take place, generally twice in the course of a lunar day, or of 24h. 49m. of mean solar time, in most of the shores of the ocean, and in the greater part of the bays, firths, and rivers which communicate freely with it. The tides form what are called a *flood* and an *ebb*, a *high* and *low* water. The whole interval between high and low water is called a *tide*; the water is said to *flow* and to *ebb*, and the rising is called the *flood tide*, and the falling the *ebb tide*. The rise or fall of the waters, in regard to elevation or depression, is exceedingly different at different places, and is also variable everywhere. The different heights of tide succeed each other in a regular series, diminishing from the greatest to the least, and then increasing from the least to the greatest. The greatest is called a *spring tide*, and the least a *neap tide*. This series is completed in about 15 days, or rather two series are completed in a lunar month. For the spring tide at any place happens at a certain interval of time, generally between one and two days, after new or full moon; and the neap tide, at a certain interval after the first or last quarter. Thus, the whole series of tides appears to be chiefly regulated by the moon, and to be only to a small extent under the influence of the sun. The moon, by her attraction, not only raises the waters of the ocean under her, but also at the same time raises them on the opposite side; the sun also raises similar waves by his attraction, but to a much less extent, owing to his great distance. Hence, the combined actions of the sun and moon, when these bodies are in conjunction, or opposition, that is at new or full moon, may be readily conceived to produce the spring tides, and the diminutions of each other's attractions when in quadratures to produce the neap tides. These tides will also vary, according as the sun or moon is in perigee or apogee, and likewise according to their respective declinations. The interval between two succeeding high waters is variable. It is shortest about new and full moon, being then about 12h. 19m.; and about the time of the moon's quadratures it is 12h. 30m. But these intervals are somewhat different at different places. The tides being of great importance to all commercial nations, it becomes an object of great importance to obtain the means of predicting them, but the subject, in a general point of view, is attended with many difficulties, and each place requires to have its own tide tables. The theory of the tides, considered as a consequence of the attractions of the sun and moon, unites some of the greatest difficulties that occur in the various departments of natural philosophy and astronomy.—*Atmospheric tides*, waves produced in the atmosphere similar to those produced in the waters of the ocean, and by the same causes, viz., the attractions of the sun and moon.—

Priming and lagging of the tides, an effect of the combination of the solar and lunar tides. In the first and third quarters of the moon, the solar wave is to the westward of the lunar one, and consequently the observed tide, which is the result of the combination of the two waves, will be to the westward of the place it would occupy, if the moon acted alone, and the time of high water will be accelerated. Hence what is termed the *priming* of the tides. In the second and fourth quarters, the general effect of the sun is to produce, for a like reason, a retardation in the time of high water. Hence what is called the *lagging* of the tides. These effects are most remarkable about the time of new and full moon.—3. Stream; course; current; as, the *tide of the times*.

Note.—In this use, *till* is not a conjunction; it does not connect sentences like *and*, or *like or*. It neither denotes union nor separation, nor an alternative. It has always the same office, except that it precedes a single word or a single sentence; the time to which it refers being in one case expressed by a single word, as *now*, or *then*, or *time*, with *this*, or *that*, &c., and in the other by a verb with its adjuncts; as, occupy *till* I come, that is, *to* I come. In the latter use, *till* is a preposition

preceding a sentence, like *against*, in the phrase, *against* I come.

TILT'-HAMMER, n. [*tilt* and *hammer*.] A heavy hammer used in iron works, which is worked by machinery, impelled either by a water-wheel or a steam-engine. Such hammers are extensively used in the manufacture of iron and steel. The hammer used for hammering the *blooms* of iron, is usually called a *lift* or *helve* hammer, and is sometimes of the enormous weight of six tons. The tilt-hammer, properly so called, is of lighter dimensions, and is worked with greater rapidity; a specimen of the kind usually employed in the manufacture of steel, and in the forging of anchors, axles, &c., is represented in the accompanying engraving.

Tilt-hammer.

a is the shank or helve, usually formed of timber, and sometimes of wrought iron; it is hung upon an axis at about one-third of its length, and is worked by a series of revolving cams or tappets, *c, c*, fixed into the circumference of the *cam-ring, b*, mounted upon the shaft of a steam-engine or water-wheel. These cams act successively by depressing the shorter limb of the shank, *a*, until, by the continued revolution, it is disengaged, and the opposite extremity, armed with a heavy cast-iron hammer, *d*, descends with considerable force upon the anvil, *e*. Thus a repetition of blows is kept up as long as may be required.

crest; *timmeren*, to build; *timmerhout*, timber; G. *zimmer*, an apartment; *zimmer*, to square, fit, fabricate; *zimmerholz*, timber. If *m* is radical, which is probable, this word coincides with Gr. *δῆμα*, L. *domus*, a house, and Gr. *δῆμας*, the body. The primary sense is probably to set, lay, or found.] 1. That sort of wood which is squared, or capable of being squared, and fit for being employed in house or ship-building, or in carpentry, joinery, &c. We apply the word to standing trees which are suitable for the uses above mentioned, as a forest contains excellent *timber*; or to the beams, rafters, boards, planks, &c., hewed or sawed from such trees. But in the language of the customs, when a tree is sawn into thin pieces, not above 7 inches broad, it is called *batten*; when of greater breadth, such thin pieces are called *deal*. Timber is generally sold by the load. A load of rough or unhewn timber is 40 cubic feet, and a load of squared timber 50 cubic feet. In regard to planks, deals, &c., the load consists of so many square feet: thus, a load of 1 inch plank is 600 square feet. The most useful timbers of Europe are the oak, the ash, the Scotch pine, the larch, and the spruce fir; those of North America, are the hickory, the different species of pine, and some species of oak; those of tropical countries, are the teak tree, the different species of bamboo, and the palm. *Wood* is a general term, comprehending under it timber, dye woods, fancy woods, firewood, &c., but the word *timber* is often used in a loose sense for all kinds of felled and seasoned wood.—2. TIME, n. Hence the sense of *temples*, L. *tempora*, the falls of the head, also *tempest*, &c. See **TEMPEST**. *Time* is primarily equivalent to *season*; to the Gr. *καιρος* in its original sense, *opportunity*, *occasion*, a fall, an event, that which comes.] 1. A particular portion or part of duration, whether past, present, or future. The *time* was; the *time* has been; the *time* is; the *time* will be.

3. Duration.

The equal and uniform flux of *time* does not affect our senses. *Cyc*.

Time is *absolute* or *relative*; *absolute* time is considered without any relation to bodies or their motions. It is conceived by us as unbounded, continuous, homogeneous, unchangeable in the order of its parts, and divisible without end. *Relative* time is the sensible measure of any portion of duration, by means of motion. Thus the diurnal revolution of the sun measures a space of time or duration. Hence,—4. A

space or measured portion of duration. In this sense, time is measured by certain conventional or natural periods, and often marked by particular phenomena; as the revolution of the heavenly bodies, more especially the revolution of the sun, or the rotation of the earth on its axis. Time is divided into years, months, weeks, days, hours, minutes, and seconds, but of these portions the years and days only are marked by celestial phenomena. In order to measure time we employ some equable motion, and we judge those times to be equal, which pass while a moving body proceeding with a uniform motion passes over equal spaces. The machines employed for measuring time are clocks, watches, chronometers, clepsydres, hour-glasses, and dials, but the three former are those chiefly used.—5. Repetition; doubling; addition of a number to itself; as, to double cloth four *times*; four *times* four amount to sixteen.—10. In *music*, the relative duration of sounds or the measurement of that duration. The term is also used to signify that which divides a bar into two or three equal parts, and subdivides these; and likewise the movement, that is, the quickness or slowness of a composition. The duration of a single sound is known by the particular note, that is, as minim or crotchet, &c. The semibreve is considered as the measure note, it being the longest. Its average length is about four beats of a healthy man's pulse. In regard to the division of bars, the time is either duple or triple, of which there are several varieties. A variety of terms are employed to indicate the movement, as *andante*, *adagio*, *allegro*, &c. In concerts, it is all important that the performers keep *time*, or exact *time*.—11. The state of things at a particular period; as when we say, good *times*, or bad *times*, hard *times*, dull *times* for trade, &c. In this sense, the plural is generally used.—12. The latter signifies tin, pewter, and a pond, L. *stagnum*.] 1. A metal of a white brilliant colour, slightly tinged with grey, being one of the simple or elementary bodies. In hardness it is intermediate between gold and lead; it is very malleable, and may be beaten out into leaves less than the thousandth of an inch in thickness. It is more tenacious than lead, and very flexible, and when bent in the fingers it emits a peculiar crackling sound. Its specific gravity is 7.2. It melts at 442°, and if heated to whiteness in air, it takes fire and burns with a white flame, forming peroxide of tin. Tin is rather a scarce metal, being found in few places of the world in any quantity. The mines in Cornwall are its most productive source; it also occurs in Bohemia, Saxony, and Spain; in Malacca and Banca, in Asia; in Mexico and Chili; and in Massachusetts, in North America. There are only two ores of tin: the native peroxide, called *tin-stone*, and the double sulphuret of tin and copper, called *tin pyrites*,—*whicli see*. The peroxide of tin is found in Cornwall in two forms: 1. In veins where it is blended with several other metals; as arsenic, copper, zinc, and tungsten; 2. In loose rounded masses, grains, or sand in alluvial soil, in which state it is called *stream tin*. The former, when reduced to the metallic state, yields *block tin*, while the latter yields *grain tin*, which is the purer of the two. What is termed *wood tin* is found in reniform and botryoidal masses, or in wedge-shaped pieces. Oxygen combines with tin, forming the *protoxide*, *sesquioxide*, and *peroxide* of tin. Chlorine unites with tin, forming the *protochloride* and *perchloride* of tin. The compounds of sulphur and tin are the *protosulphuret*, *sesquisulphuret*, and *persulphuret*. The uses of tin are numerous. It is much used as a covering to several other metals, as in tin-plate, and cooking vessels of copper. Combined with copper it forms *bronze*, *bell-metal*, and several other useful alloys. With lead it forms *pewter*, and solder of various kinds. Tin-foil coated with mercury forms the reflecting surface of glass-mirrors. The solutions of tin in the nitric, muriatic, nitro-sulphuric, and tartaric acids, are much used in dyeing. Tin is much

2. In *anat.*, texture or organization of parts. The peculiar intimate structure of a part is called its *tissue*. A part of a fibrous structure is called a *fibrous tissue*. The organs of the body are made up of simpler elements, some generally diffused through the body, and others peculiar to particular organs. These simpler structures are called the *tissues* of the body; as, the cellular *tissue*; the mucous *tissue*, &c. The cellular *tissue* is the cellular membrane.

—3. In *bot.*, the minute elementary parts of which the organs of plants are composed. These elementary structures differ from each other, and are so minute as generally to be distinctly visible only with the aid of the microscope. They are named *elementary organs*, *organic tissue*, or *vegetable tissue*. When a leaf or a portion of the stem of one of the higher plants is submitted to the microscope, it is found to consist, 1. of a thin transparent homogeneous membrane, which is arranged in the form of cells or cylindrical tubes; 2. of fibres which are arranged in a spiral form in the interior of the cells or tubes; and, 3. of a fluid, filling the cells, and existing between them, and containing in it globules of various sizes and kinds. These parts constitute what are known respectively as *elementary membrane*, *elementary fibre*, and *organic mucus*. The elementary fibre is only found in the higher forms of plants, the other two are found in all plants. The *tissues* of plants then are composed of elementary membrane and elementary fibre, and the principal forms under which they exhibit themselves constitute the *fibrous tissue*, *cellular tissue*, and *vascular tissue*. *Fibrous tissue* is that in which elementary fibre alone is apparent. *Cellular tissue* is composed of membrane in the form of cells or cavities which are closed on all sides, and are commonly of a spheroidal form, although they often assume various other forms. The pith of plants is entirely composed of cellular tissue, but it enters largely into the structure of other parts, and in many is the only tissue. When the cells are composed of membrane and fibre combined, or of fibre alone, they constitute the *fibro-cellular tissue*. *Vascular or tubular tissue* is composed of very elongated membranous tubes, tapering at each end. It comprehends the *woody* and *laticiferous tissues*. When the tubes have within them a spiral fibre, or their walls marked with broken spiral lines or dots, arranged in a circular or spiral direction, they constitute *fibro-vascular tissue*.—4. It was afterwards discovered by Klaproth in some other minerals, and he gave it the name it now bears. In 1822, Wollaston examined it, and ascertained its properties. It is found oxidized in several minerals; and occurs occasionally in the metallic form, in the slag iron works; as small cubical crystals, exactly similar to bright copper in appearance; of specific gravity 5.3, and very infusible. When heated with nitre they are oxidized, producing titanic acid. Titanium is dissolved in a mixture of nitric and hydrofluoric acid, under a very high temperature. Oxygen and titanium combine, forming the protoxide, which is a deep purple-coloured powder, and the peroxide or titanic acid. Titanium also combines with chlorine forming a bichloride, and with sulphur forming a bisulphuret. The legislature assembles annually to make and amend laws. The court will sit in February to try some important causes.—23. It precedes the radical verb after adjectives, noting the object; as, ready to go; prompt to obey; quick to hear, but slow to censure.—24. It precedes the radical verb, noting the object.

After *have* it denotes duty or necessity. I have a debt to pay on Saturday.—29. *To-day*, *to-night*, *to-morrow*, are peculiar phrases derived from our ancestors. *To* in the two first, has the sense or force of *this*; *this day*, *this night*. In the last, it is equivalent to *in* or *on*; *in* or *on* the morrow. The words may be considered as compounds, *to-day*, *to-night*, *to-morrow*, and usually as adverbs. But sometimes they are used as nouns; as, *to-day* is ours.—*To* and *fro*, backward and forward. In this phrase, *to* is adverbial.—*To the face*, in presence of; not in the absence of.

I withstood him face to face; Gal. ii.

To-morrow, *to-morrow*, and *to-morrow*; Creeps in this petty pace from day to day.

Shak.

Note. In the foregoing explanation of *to*, it is to be considered that the definition given is not always the sense of *to* by itself, but the sense rather of the word preceding it, or connected with it, or of *to* in connection with other words. In general, *to* is used in the sense of moving toward a place, or toward an object, or it expresses direction toward a place, end, object, or purpose. *To* is often used adverbially to modify the sense of verbs; as, *to come to*; *to leave to*. The sense of such phrases is explained under the verbs respectively. In popular phrases like the following, "I will not come; you shall *to*, or *too*," a genuine Saxon

phrase, *to* denotes moreover, besides, *L. insuper.*

There are many other species of *Nicotiana*, most of which yield tobacco for smoking, and many of these are cultivated in the gardens of Europe. TOLERA/TION, *n.* [L. *toleratio*.] The act of tolerating; the allowance of that which is not wholly approved; appropriately, the allowance of religious opinions and modes of worship in a state, when contrary to or different from those of the established church or belief. *Toleration* implies a right in the sovereign to control men in their opinions and worship, or it implies the actual exercise of power in such control. Every person is as much entitled to liberty of opinion on religious subjects as on any other, and has a right to adopt any mode of worship, and hold any doctrines which are not inconsistent with the peace and safety of the state, and the moral welfare of its members. The civil magistrate has a right to check the propagation of opinions and doctrines, which tend only to sap the foundations of morality, and to disturb the peace of society; but he has no right to restrain men from publicly professing any system of faith, which comprehends the being and providence of God, the great laws of morality, and a future state of rewards and punishments. There are two kinds of toleration, as laid down by Paley: 1. The allowing to dissenters the unmolested profession and exercise of their religion, but with an exclusion from offices of trust and emolument in the state; this is called a *partial* toleration. 2. The admitting dissenters, without distinction, to all the civil privileges and capacities of other citizens; this is called a *complete* toleration. Where no power exists or none is assumed to establish a creed and a mode of worship, there can be no *toleration*, in the strict sense of the word, for one religious denomination has as good a right as another to the free enjoyment of its creed and worship.—2. In an *eccles. sense*, the allowance which the church grants to its members to differ in certain opinions, not considered fundamental.—*Toleration act*, an act passed in the reign of William and Mary, in favour of dissenters and Roman catholics.

TOLING, *† ppr.* Drawing away; inducing to follow.

TÓN'NAGE, *n.* [from *ton*.] The weight of goods carried in a boat or ship.—2. The cubical content or burthen of a ship in tons; or the amount of weight which she may carry. Properly speaking, the tonnage of a ship is an expression for the interior capacity by the number of tons of sea water which it could contain; hence, if the interior capacity were found in cubic feet, and this divided by 35 (the number of cubic feet of sea-water which are equal in weight to one ton), the quotient would be the tonnage. The tonnage, however, is frequently understood to express the capacity, by the

number of tons of sea-water which might be contained between a horizontal plane passing through the ship when she floats in still water, with only her equipments and stores on board, and a horizontal plane passing through the ship when laden; that is, between what are called the *light-water* and *load-water* planes; the contents of that part of the ship expressed in cubic feet being divided by 35, as in the former case. The result evidently gives the weight of the ship's cargo merely. As, however, the determination of the tonnage of ships, according to either of the above cases, is very laborious and difficult in practice, several empirical rules have been laid down, by which an approximate value of the tonnage may be more easily found. Tonnage is the only term used to give an idea of the size of merchant ships, which are invariably spoken of according to their tonnage, or as being ships of 100, 500, or 1000 tons. Not only are all dues and customs levied according to the tonnage, but ships are also built, and bought and sold for a certain price per ton of their admeasurement. Sometimes the tonnage of goods and stores is taken by weight and not by measurement.—3. A duty or impost on ships, formerly estimated at so much per ton of freight, but now proportioned to the registered size of the vessels.—*Tonnage and Poundage*. [See *POUNDAQE*.]

The *tonsils* are called also from their shape, *amygdalæ*, and in popular language, *almonds*. In the *Romish church*, tonsure is the first ceremony used for devoting a person to the service of God and the church; the first degree of the clericate, given by a bishop, who with scissors cuts off a part of the candidate's hair, with prayers and benedictions. Hence, *tonsure* is used to denote entrance or admission into holy orders.—3. It is however frequently applied to any tempest or hurricane, and in this sense may be looked upon as signifying, in reference to the localities above named, what typhoon or tyfoong means in the seas of China and the eastern Archipelago. Tornadoes are usually accompanied with severe thunder, lightning, and torrents of rain; but they are of short duration, and narrow in breadth.

A genus of fishes of the Ray family (*Raidæ*), distinguished by their having the tail short and moderately thick, and the disk of the body nearly circular, the anterior margin being formed by two produced portions from the head, which, inclining sideways, join

the pectorals. There are several species, which are commonly confounded with each other. These fishes are usually taken in forty fathoms water, on the coasts of France and England, and in the Mediterranean. A touch of them occasions a numbness in the limb, accompanied with an indescribable and painful sensation, and is really an electric shock. The electrical apparatus in the Torpedo, consists of small membranous tubes, which occupy the space

Spotted Torpedo (*T. narke*).

between the head, the pectoral fins, and the branchiae. They are disposed like a honey comb, and divided by horizontal partitions into small cells, which are filled with a mucous substance, the whole being in many respects analogous to the galvanic pile. The shocks given by the Torpedo are very severe, and are supposed to be used by the animal, both as a means of defence and of disabling its prey. When dead, they lose the power of producing this sensation.—2. A machine invented by Robert Fulton, an American, for destroying ships, by blowing them up. The principal part of the apparatus consisted of a copper box or case, enclosing a certain quantity of gun-powder and combustible matter. These cases were to be applied under the keels of the vessels to be destroyed by means of a kind of submarine boat. The inventor, who was encouraged in his scheme by Bonaparte, attempted, by means of his *infernal machine*, to blow up a British man-of-war in 1801, but providentially failed, owing to the vessel suddenly changing her position. **TORPENT**, *a.* [*L. torpens, torpeo.*] Numbened; torpid; having no motion or activity; incapable of motion.

TORRICELLIAN, *a.* Pertaining to Torricelli, an Italian philosopher and mathematician, who, in 1643, discovered the true principle on which the barometer is constructed, by means of an experiment called from him the *Torricellian experiment*. This experiment consisted in filling with mercury a glass tube closed at one end, and then inverting it, and bringing the open end under the surface of mercury in a vessel; when the column of mercury in the tube was observed to descend, till it stood at a height equal to about 29½ inches above the level of the mercury in the vessel, leaving what is considered to be a perfect vacuum at the top, between the upper extremity of the column and that of the tube. This experiment led to the discovery that the column of mercury in the tube is supported by the pressure of the atmosphere, acting on the surface of the mercury in the vessel, and that this column is an exact counterbalance to the atmospheric pressure. [*See BAROMETER.*—*Torricellian tube* is a glass tube thirty or more inches in length, open at one end, and hermetically sealed at the other, such as is used in the barometer.—*Torricellian vacuum*, a vacuum produced by filling a barometer tube with mercury, as in the Torricellian experiment; the vacuum above the mercurial column in the barometer.

TORSEL, *n.* [*supra.*] Any thing in a twisted form.—2. In *arch.*, torsels are the pieces of timber lying under the mantle-tree. They are otherwise called *tassels*.

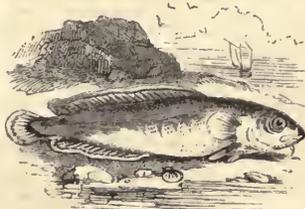

TORSION, *n.* [*L. torsio, from torqueo, to twist.*] The act of turning or twisting.—2. In *mech.*, the twisting or wrenching of a body by the exertion of a lateral force. The resistance which cylinders and prisms formed of different substances oppose to torsion, furnishes one of the usual methods of determining the strength of materials. Such machines as capstans and windlasses, also axles which revolve with their wheels, are, when in action, subject to be twisted, or undergo the strain of torsion. If a slender rod of metal be suspended vertically, so as to be fixed at the point of suspension, and then twisted through a certain angle, it will, when the twisting force

ceases to act, untwist itself, or return in the opposite direction with a greater or less force or velocity until it come to rest in its original position. The limits of torsion within which the body will return to its original state, depend upon its elasticity; and the force with which it tends to recover its natural state is called *elasticity of torsion*. This force is always proportional to the angle through which the body has been twisted. If a body is twisted so as to exceed the limit of its elasticity, its particles will either be wrenched asunder, or it will take a *set*, and will not return to its original position on the withdrawal of the twisting force. The word *torsion* is also used to signify that force with which a thread or slender wire returns to a state of rest when it has been twisted by being turned round on its axis; the thread or wire, which is suspended vertically, being attached at the upper extremity to some fixed object, and having at its lower extremity a weight with a horizontal index, or a stirrup, which is to carry a needle or bar in a horizontal position.—*Torsion balance*, or *Balance of torsion*. If a piece of very fine wire, silk, or spun glass, be suspended in the manner above stated, and then twisted, it will, when released, begin to untwist itself, and by the momentum acquired in the act of untwisting, will twist in the opposite direction to a greater or less extent, according to the amount of twisting to which it had been subjected. It will then begin to return; and thus by a series of oscillations continually diminishing in extent, it will at length gradually settle in its original position. Now, if a needle or an index be attached to the lower extremity of the suspended wire or thread, and a graduated circle placed immediately beneath the index in a horizontal position, so that the centre of the circle may be directly below the point of suspension of the index, the apparatus thus constructed will form the *torsion balance*. This balance has been employed to measure certain forces too minute to be estimated by the ordinary methods, and by means of it Coulomb was enabled to determine, by direct experiment, the laws which govern the variation of magnetic and electric forces. By means of the same instrument, Cavendish afterward detected and measured the attraction of gravitation existing between balls of lead. To measure small forces, such as those of electricity, magnetism, &c., with the torsion balance, they are made to act upon one extremity of the index, and thus cause it to turn round, and when the force is in equilibrium with the tendency of the suspended wire to untwist, the angle which the index makes with its original position, which is called the *angle of torsion*, and which is measured by the graduated circle, is the measure of the force employed. In making experiments with the torsion balance, the length of the suspended wire, its diameter, and the weights attached to its lower extremity, must be taken into account. When the balance is adapted to measure electric forces, it is called the *torsion electrometer*; when it is adapted to measure galvanic forces, it is called the *torsion galvanometer*; and, when applied to measure magnetic forces, it

receives the name of the *torsion magnetometer*.

The tortoises form a numerous and highly interesting order (Testudinata) of reptiles. They are also called Chelonians from *χελών* (*Chelone*), the Greek name for a tortoise, and are readily distinguished by the double shield in which their body is enclosed, whether they are terrestrial, fresh water, or marine. They were all comprised by Linn. under his genus *Testudo*, but modern naturalists

Common or Greek Tortoise (*Testudo Graeca*).

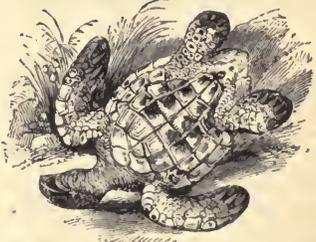

have subdivided them chiefly according to the forms and teguments of their shell, and their feet. According to some of the modern arrangements, the land tortoises form the genus *Testudo*;

the fresh-water tortoises, the genus *Emys*; and the sea tortoises, the genus *Chelonia*. Those Chelonians which resemble fresh-water tortoises, but are distinguished from them by their mouth, which opens cross-wise, and is unarmed with the horny beak common to the former, form the genus *Chelys*, while the soft-shelled tortoises form the genus *Trionyx*.—2. horny scales or plates which form the covering of this animal, under the name of *tortoise-shell*, are extensively used in the manufacture of combs, snuff-boxes, &c., and in inlaying and other ornamental work. The goodness of tortoise-shell depends mainly on the thickness and size of the scales, and in a smaller degree upon the clearness and brilliancy of the colours. The best tortoise-shell is that of the Indian archipelago.

One who, in political principles, always leans to church and state; who supports the regal, ecclesiastical, and aristocratical institutions of the country, and who is jealous of the extension of democratic power. The *tories* thus differ from the *whigs* and *radicals*, who, on the other hand, are jealous of the encroachments of the crown, and the privileged classes, and who give their support, in various degrees, to an extension of the power of the people. Of late years the term *conservative* has been adopted by the *tories*, as tending to convey the best idea of their principles. [See *CONSERVATIVE*.] The distinctions of *tory* and *whig*, as applied to political partisans, were not known before the year 1678, in the reign of Charles II. [See *WHIG*.]

Perhaps the most remarkable species is the *T. melanoleucus*, a native of North America, known to sportsmen by the name of Tell-tale. Although the sense of touch is diffused over the whole body, it is much more exquisite in some parts than others. In man the hand is the principal organ of touch, and the greatest degree of sensibility resides in the extremities of the fingers. By the sense of touch we are enabled to ascertain the properties of bodies, in so far as they can be ascertained by contact. The arms usually employed were lances without

heads, and with round braces of wood at the extremity, and swords without points, and with blunted edges; but those who desired to signalize themselves in an extraordinary degree, encountered each other with the ordinary arms of warfare. Tournaments were usually held on the invitation of some prince, which was proclaimed by heralds throughout his own dominions, and likewise at foreign courts, so that parties from different countries might join in such exercises. The tournament differed from the *joust*, which was merely a trial of military skill between one knight and another.

TRADE-WINDS, *n.* [*trade* and *wind*.] The trade-winds are those perpetual or constant winds which occur in all open seas, on both sides of the equator, and to the distance of about 30 degrees north and south of it. They are so named because they are favourable to navigation and trade. On the north of the equator, their direction is from the north-east, (varying at times a point or two of the compass either way); on the south of the equator they proceed from the south-east. The origin of the trade-winds is this:—the great heat of the torrid zone rarefies and makes lighter the air of that region, and in consequence of this rarefaction, the air rises, and ascends into the higher regions of the atmosphere. To supply its place, colder air from the northern and southern regions rushes towards the equator, which, also becoming rarefied, ascends in its turn. The heated

air which thus ascends into the upper regions of the atmosphere, being there condensed, flows northward and southward to supply the deficiency caused by the under currents blowing towards the equator. These under currents coming from the north and south, are, in consequence of the earth's rotation on its axis, deflected from their course as they approach the equatorial region, and thus become north-east and south-east winds, constituting the trade-winds. The space included between the second and fifth degrees of north latitude, is the internal boundary of the trade winds; and this space experiences calms, frequently interrupted, however, by violent storms. The position of the sun has an influence on the strength and direction of the trade-winds; for when the sun is near the tropic of Cancer, the south-east wind becomes gradually more southerly and stronger, and the north-east weaker and more easterly; the effect is reversed when the sun approaches towards the tropic of Capricorn. Trade-winds are constant only over the open ocean, and the larger the expanse of ocean over which they blow, (as in the Pacific), the more steady they are. When these winds blow over land, they are obstructed and their direction changed by coming in contact with high land or mountains. In some places the trade-winds become periodical, blowing one half of the year in one direction, and the other half in the opposite direction. [*See* MONSOON.]

A variety of gum familiarly termed gum-dragon. It is the produce of several species of the genus *Astragalus*. The greater part of this gum used in Europe is yielded by *A. verus*, a native of the north of Persia, Armenia, and Asia Minor, and by *A. gummifer*, a native of

colour is whitish or yellowish. Both sorts are hard, yet somewhat soft, and even flexible before breaking; the fracture dull and splintery. *Tragacanth* is devoid of taste or smell. It swells in the mouth, and is lubricous. It is composed of gum, bassorin, starch, and vegetable membrane, and is imperfectly soluble. It is used in the form of mucilage, and of powder, to suspend heavy powders in water, and also to make lozenges and pills. It is demulcent, and is used in coughs and catarrhs. According to this opinion, tragedy properly signifies a *melancholy* song.] 1. A dramatic poem representing some signal action performed by illustrious persons, and generally having a fatal issue. A Greek tragedy always consisted of two distinct parts; the dialogue, which corresponded in its general features to the dramatical compositions of modern times; and the chorus, the whole tone of which was lyrical rather than dramatical, and which was meant to be sung while the dialogue was intended to be recited. The unity of time;—namely, that the duration of the action should not exceed twenty-four hours; and that of place,—namely, that the scene in which the events occur should be the same throughout, are modern inventions. Eschylus is called the father of *tragedy*.—2. A fatal and mournful event; any event in which human lives are lost by human violence, more particularly by unauthorized violence.

These transactions contain the several discoveries and histories relative to the sciences, such as natural history, mathematics, mechanical philosophy, chemistry, &c., either made by the members themselves, or communicated by them from their correspondents, with the various experiments, observations, &c., made by them or transmitted to them.

In the *Kantian philosophy*, pertaining to that which transcends or goes beyond the limits of actual experience. The term, however, as distinguished from *transcendent*, is applied to that which does not indeed originate from experience, but yet is connected with it, because it contains the grounds of the possibility of experience. "I call," says Kant, "all knowledge *transcendental*, which occupies itself not so much with objects as with the way of knowing these objects, as far as this is possible *à priori*. A system of such notions would be called *transcendental philosophy*, and would be the system of all the principles of pure reason;" or, as he says in another passage, "the pure, merely speculative reason from which the practical is separated."—In *math.*, a term applied to any equation, curve, or quantity which cannot be represented or defined by an algebraical equation of a finite number of terms, with numeral and determinate indexes. Transcendental quantities include all exponential, logarithmic, and trigonometrical lines, because there is no finite algebraical formulae by which these quantities can be expressed.—*Transcendental equation* is an equation into which transcendental quantities enter. But *transcendental* equations sometimes signify such differential equations as can only be integrated by means of some curve, logarithm, or infinite series.—*Transcendental curve* is such as cannot be defined by any algebraic equation, or of which, when it is expressed by an equation, one of the terms is a variable quantity.

TRANSCENDENTALISM, *n.* In the *Kantian philosophy*, the transcending or going beyond empiricism, and ascertaining *à priori*, the fundamental principles of human knowledge. But, according to Schelling and Hegel, who reject Kant's distinction between *transcendent* and *transcendental* ideas, transcendentalism is that which aims at a true knowledge of all things, material and immaterial, human and divine, so far as the mind is capable of knowing them. And in this sense the term *transcendentalism* is now most used. Sometimes it is also used for that which is vague and illusive in philosophy.

In *astron.*, the passage of a heavenly body across the meridian of any place. The passage of one heavenly body over the disc of a larger one. But the term is chiefly

restricted to the passage of the inferior planets, Mercury and Venus, over the sun's disc. The transits of Venus are of great importance in astronomy, as they afford the best means of determining the sun's parallax, and consequently the dimensions of the planetary system. These transits are of rare occurrence. The last one took place June 3, 1769, and the next will happen December 8, 1874. The transits of Mercury occur more frequently, but they are comparatively useless, from the difficulty of observation.

The instrument is susceptible of certain nice adjustments, so that the axis can be made perfectly horizontal, and at right angles to the plane of the meridian, in which plane the telescope must move. The principal use of the transit instrument is to determine the exact moment when a celestial body passes the meridian of the place of observation. [*See TRANSIT.*]

TRANS'ITION, *n.* (*transizh'on.*) [*L. transitio.*] 1. Passage from one place or state to another; change; as, the *transition* of the weather from hot to cold. Sudden *transitions* are sometimes attended with evil effects.

The term *transition*, however, is no longer applicable in its original signification; and, accordingly, modern geologists include within the tertiary series all kinds of stratified rocks, from the earliest slates, in which we find the first traces of animal and vegetable remains, to the termination of the great coal formation. [*See STRATA.*]

In this sentence, the act of writing, performed by Cicero, the agent, terminates on letters, the object. All verbs not passive, may be arranged in two classes, *transitive* and *intransitive*. In *Eng.*, this division is correct and complete.

This property is supposed to arise from the disposition of the particles which compose the transparent body. No substance, however, can be said to be perfectly transparent; that is, there is no substance which does not intercept some part of the light incident upon it, and the transparency of a substance, as water and glass, diminishes as its thickness or depth increases. But the term includes numerous acts and circumstances, which constructively and remotely, as well as immediately, affect the safety of the king's person; such as the violation of females of the royal family, levying war against the king in his realm, adherence to the king's enemies, counterfeiting the king's seals, the offence of slaying the chancellor or the judges; also, writings which import such compassings, or devices, attempts, or intentions, if published or shown to third persons, or words of advice, or persuasion, importing deliberation and design. There are no accessories to treason; all are held to be principals. The punishment for treason is, that the offender be drawn on a hurdle to the place of execution, and there hanged; that his head should be cut off; and the body divided into four quarters; but the king by warrant may dispense with all the immaterial parts of the punishment. The party attainted for treason forfeits all lands and property, and his heirs cannot take by any descent through him. Formerly treason used to be styled *high treason*, in contradistinction to what was termed *petty treason*, which was the killing of a master by his servant, a husband by his wife, but every offence which formerly amounted to petty treason is now deemed to be murder only, and not treason. In the United States, treason is confined to the actual levying of war against the United States, or in adhering to their enemies, giving them aid and comfort. TREASONABLE, *a.* (*tree'znable*.) TREASURER, n. (trezh'urer.) One who has the care of a treasure or treasury; an officer who receives the public money arising from taxes and duties or other sources of revenue, takes charge of the same, and disburses it upon orders drawn by the proper authority. Incorporated companies and private societies have also their *treasurers*.—*Lord high treasurer*, formerly the third great officer of the crown, who had under his charge and government all the king's revenue, which is kept in the Exchequer; but at present the duties of the lord high treasurer are discharged by commissioners entitled *lords of the treasury*. [See **TREASURY**.]—*Lord high treasurer of Scotland*, formerly an officer whose duty it was to examine and pass the accounts of the sheriffs, and others concerned in levying the revenues of the kingdom, to receive resignations of lands, and other subjects, and to revise, compound, and pass signatures, gifts of tutory, &c. The treasurer of the household, in the absence of the lord-steward, has power with the controller and other officers of the Green-cloth, and the steward of the Marsh-ale, to hear and determine treasons, felonies, and other crimes committed within the king's palace. In this case, the treasure becomes vested in the king by virtue of his prerogative; but if the owner is known or is ascertained after the treasure is found, the owner and not the king is entitled to it. In former ages, when persons were in the practice of burying their money, and other treasures in the earth, on account of the insecurity of property, *treasure-trove* became an important branch of

the revenue of this and of most other European states.

TREASURING, pp. Hoarding; laying up for future use.

—2. A department of government, which has control over the management, collection, and expenditure of the public revenue. The duties of this department are at present performed by a board of five lords commissioners, instead of a lord high treasurer, as in former times. The chief of these commissioners, or first lord of the treasury, is generally the prime minister for the time being; the other four junior lords have usually seats in parliament, as have also the two joint secretaries of the treasury. The other subordinate officers are a number of clerks, a receiver of fees, a keeper of the papers, a solicitor, a chamber keeper, messengers, house-keepers, extra clerks and extra messengers. The departments immediately under the control of the treasury, are the boards of customs, of excise, of stamps and taxes, and the post-office, the various officers in which are to a great extent appointed by the lords of the treasury. The chancellor of the Exchequer has the special management of the revenue and expenditure of the nation, and when the prime minister or first lord of the treasury is a peer, the former takes the lead of the ministerial party in the house of commons, in which the seats occupied by that party are called the *treasury benches*. When the first lord of the treasury is a commoner, the offices of the prime minister and chancellor of the Exchequer are sometimes united in the same person.—3. A building appropriated for keeping public money; John viii. Also for keeping accounts of public money.—4. The officer or officers of the treasury department. [See **No. 2**.]—5. 2. An agreement, league, or contract between two or more nations or sovereigns, formally signed by commissioners properly authorized, and solemnly ratified by the several sovereigns or the supreme power of each state. Treaties are of various kinds, as, *treaties* for regulating commercial intercourse, *treaties* of alliance, offensive and defensive, *treaties* for hiring troops, *treaties* of peace, &c. In most monarchies, the power of making and ratifying treaties is vested in the sovereign; in republics, it is vested in the chief magistrate, senate, or executive council; in the United States of America it is vested in the president, by and with the consent of the senate; while in the Germanic confederation, the particular states have the right of making treaties of alliance and commerce not inconsistent with the fundamental laws of the confederation. The East India Company enjoys the right of making treaties under certain limitations; but in all cases treaties can only be made by the sovereign power in a state, or by

parties upon whom the sovereign power has conferred that right. Hence, in order to enable a public minister or other diplomatic agent to conclude and sign a treaty, he must be furnished with full power by the sovereign authority, and the treaty concluded in this manner is binding on the state, in the same manner as if it had been concluded immediately by the sovereign power. In most constitutional governments it is necessary that the sanction of the legislative body be given to treaties of commerce, or those which impose taxes on the people, entered into by the executive—3. † Entreaty.

TREATY-MAKING, a. Authorized to make or form treaties; as, a *treaty-making power*.

TRI-PANG, } rine animal of the genus *Holothuria*, belonging to the order *Radiata*. It is found chiefly on coral reefs in the eastern seas, and is highly esteemed as an article of food in China, into which it is imported in large quantities. It is an unseemly looking animal, somewhat resembling the land-slug in shape, but having rows of tentaculi-form suckers on its body, and a radi-

ated mouth. The ordinary length is about a span, and the girth two or three inches, although some are found two feet in length, and seven or eight inches in circumference. When the trepan is taken, it is gutted, dipped for a short time in boiling water, then boiled in salt water for eight or ten hours, along with pieces of red mangrove bark, then dried and smoked over a wood fire, and this is all the preparation it receives. The fishery is carried on in numerous localities in the Indian ocean, the eastern Archipelago, and on the shores of Australia. The whole produce goes to China.

It consists of a cylindrical saw, with a handle placed transversely, like that of a gimlet, and has a sharp steel point, called the centre-pin, which may be fixed and removed at pleasure, and which stands in the centre of the circle formed by the saw, but projecting a little below the edge of the saw. The centre-pin is fixed in the skull, and forms an axis, round which the circular edge of the saw rotates, and as soon as the teeth of the saw have made a circular groove in which they can work steadily, the centre-pin is removed. The saw is made to cut through the bone, not by a series of complete rotations, such as are made by the trepan, but by rapid half rotations, alternately to the right and left, as in boring with an awl. The trephine is used especially in injuries of the head, and in cases resulting from injuries, for which the removal of a portion of the brain is necessary. The use of the trephine, however, is now much more rarely required than in former times, owing to improved modes of treating cases to which it was formerly applied, and the invention of simpler and more effective instruments.

The three angles of a plane triangle are equal to two right angles, or 180°, and its area is equal to half that of a rectangle or parallelogram of the same base and altitude. The triangle is the most important figure in geometry, and may be considered the element of all other figures. If the three lines or sides of a triangle are all right, it is a *plane* or *rectilinear* triangle; as, figs. 1, 2, 3, 4. If all the three sides are equal, it is an *equilateral* triangle; fig. 2. If two of the sides only are equal, it is an *isosceles* or *equicrural* triangle; fig. 3. If all the three sides are unequal, it is a *scalene* or *scaleneous* triangle; fig. 4. If one of

If all the angles are acute, the triangle is *acutely-angled* or *oxygonous*; figs. 2, 3. If the three lines of a triangle are all curves, the triangle is said to be *curvilinear*; fig. 5. If some of the sides are

right and others curve, the triangle is said to be *mixtilinear*; fig. 6. If the sides are all arcs of great circles of the sphere, or arcs of the same circle, the triangle is said to be *spherical*; fig. 5.

TRIGONOMETRIC, *a.* Pertaining to

trigonometry. [See TRIGONOMETRICAL.]

TRIGONOMETRICAL, *a.* Pertaining to trigonometry; performed by or according to the rules of trigonometry.

Trigonometrical lines, lines which are employed in solving the different cases of plane and spherical trigonometry; as, radins, sines, tangents, secants, cosines, cotangents, cosecants, &c. These lines have certain relations to each other, and numbers representing them, or the logarithms of such numbers, are formed into tables, for facilitating calculations in trigonometry.—*Trigonometrical curves*, a name given to certain curves, which have such equations as $y = \sin x$, $y = \cos x$, $y = a \cos x + b \cos 2x$, &c. These curves may be constructed from the fundamental properties of the sine, cosine, &c.—*Trigonometrical series*, infinite series which are of the form $a \sin x + b \sin 2x + c \sin 3x$, &c., and $a \cos x + b \cos 2x + c \cos 3x$, &c.

—*Trigonometrical survey*, a term which may be applied to any survey of a country, which is carried on from a single base, by the computation of observed angular distances; but the term is usually confined to measurements on a large scale, embracing a considerable extent of country, and requiring a combination of astronomical and geodetical operations. A trigonometrical survey may be undertaken either to ascertain the exact situation of the different points of a country relatively to each other, and to the equator and meridians of the terrestrial globe, for the purpose of constructing an accurate map; or to determine the dimensions and form of the earth, by ascertaining the curvature of a given portion of its surface, or by measuring an arc of the meridian. The most minute accuracy and the most perfect instruments, are required in all the practical parts of such operations; and it becomes necessary to have regard to the curvature of the earth's surface, the effects of temperature, refraction, altitude above the level of the sea, and a multitude of circumstances, which are not taken into account in ordinary surveying. In conducting a trigonometrical survey of a country, signals, such as spires, towers, poles, erected on elevated situations, or other objects, are assumed as at great a distance as will admit of distinct and accurate observations, with telescopes of considerable power attached to the instruments used in measuring the angles. In this way the country will be divided into a series of *primary triangles*; and if any side of any one of these be measured, the remaining sides of all of them may be computed by trigonometry. By means exactly similar, each of these triangles is resolved into a number of others called *secondary triangles*; and thus the positions of towns and other remarkable objects are determined. The length of the *base* or line measured, which is an arc of a great circle, must be determined with extreme accuracy, as an error in measuring it would affect the entire survey. For checking the measurements and the computations, it is proper to measure some other line at a considerable distance from the first; as the comparison of its measured and computed lengths will be a test of the accuracy of the intermediate operations. Such a line is called a *base of verification*.

tion. The measurement of a base is one of the principal difficulties in the survey, chiefly on account of the inequalities of the earth's surface, and the variations in the length of the measuring instrument, arising from the change of temperature. The base is assumed on as flat a portion of country as can be obtained, and the chain or other measuring instrument is constructed with extreme care.

TRIGONOMETRICALLY, *adv.* According to the rules or principles of trigonometry.

TRIGONOMETRY, *n.* [Gr. *τριγωνία*, a triangle, and *μετρέω*, to measure.] According to the primitive meaning of the term, the measuring of triangles, or the science of determining the sides and angles of triangles, by means of certain parts which are given; but in its modern acceptance it includes all theorems and formulæ relative to angles and circular arcs, and the lines connected with them, these lines being expressed by numbers or ratios. In fact, the principles of trigonometry are of very general application, furnishing means of investigation in almost every branch of mathematics. Trigonometry, in relation to its practical utility, may be regarded as the most important of all the applications of mathematics, especially in relation to astronomy, navigation, and surveying. Trigonometry is of two kinds, *plane* and *spherical*, the former treating of triangles described on a plane; and the latter, of those described on the surface of a sphere. In every triangle there are six things which may be considered, viz., the three sides and the three angles, and the main object of the theoretical part of trigonometry is to deduce rules, by which, when some of these are given, the others may be found by computation, such computations being facilitated by tables of sines, tangents, &c. In plane trigonometry any three of the six parts of a triangle being given, (except the three angles,) the other parts may be determined; but in spherical trigonometry this exception has no place, for any three of the six parts being given, the rest may thence be determined, the sides being measured or estimated by degrees, minutes, &c., as well as the angles. Both plane and spherical trigonometry is divided into *right-angled* and *oblique-angled*.

The trisection of an angle, geometrically, was a problem of great celebrity among the Greek mathematicians, and in point of difficulty it is upon a footing with the duplication of the cube, and the quadrature of the circle. The indefinite trisection of an angle cannot be accomplished by plane geometry, or by the

line and circle, but it may be effected by means of the conic sections, and some other curves, as the conchoid, quadratrix, &c., the method employed by the ancient geometers. In modern analysis, there is no more difficulty of trisecting an angle than in finding a cube root.

It was granted by the senate only to a dictator, consul, or prætor, and after a decisive victory, or the complete subjugation of a province. In a Roman triumph, the general to whom this honour was awarded, entered the city of Rome in a chariot drawn by four horses, crowned with laurel, and having a sceptre in one hand, and a branch of laurel in the other. He was preceded by the senate and magistrates, musicians, the spoils, the captives in fetters, &c., and followed by his army on foot, in marching order. The procession advanced in this order along the *via sacra* to the capitol, where the general sacrificed a bull to Jupiter, and deposited his wreath in the lap of the god. Banquets and other entertainments concluded the solemnity, which was generally brought to a close in one day, though in later times it sometimes lasted for three days. During the time of the empire, the emperor himself was the only person that could claim a triumph. The *ovation* was an honour inferior to a triumph, and less imposing in its ceremonies.—2. able event, or in honour of some victorious general. The Romans were the first people who erected triumphal arches. At first they were extremely plain and simple, but afterwards the style became enriched, and the whole was at length loaded with a profusion of every sort of ornament. Latterly, they were a rectangular mass penetrated by three arches, a central one, and two smaller side ones; as, the arches of Constantine, Septimius Severus, &c. In cases where they served as gates, they were usually constructed with two archways, one for carriages passing into the city, and the other for carriages passing out of it. Many beautiful structures, in imitation of the ancient triumphal arches, have been erected in modern times. In modern times, a temporary kind of triumphal arch is frequently, on festive occasions, formed of festoons of green branches, flowers, &c.—*Triumphal column*, among the Romans, an insulated column erected in commemoration of a conqueror, to whom had been decreed the honours of a triumph; as, the columns of Trajan and Antonine.—*Triumphal crown*, a crown usually awarded by the Romans to their victorious generals. The trombone is of three kinds, the *alto*, the *tenor*, and the *base*; and in orchestral music, these are generally used together, forming a complete harmony in themselves.

The custom of erecting trophies was most general among the Greeks, but it passed at length to the Romans. The Roman trophies, however, were usually constructed of more solid and durable materials than the Greek, such as towers, columns, &c. Many representations of trophies are to be found upon ancient medals, coins, &c.

The northern one passes through the point Cancer, and is thence called the tropic of Cancer, and the southern one, which passes through the point Capricorn, is called the tropic of Capricorn. The sun's annual path in the heavens is bounded by these two circles, and they are called tropics, because when the sun, in his journey northward or southward, reaches either of them, he, as it were, turns back, and travels in an opposite direction in regard to north and south. [See ECLIPTIC SOLSTICE.]—2. In *geography*, the tropics are two parallels of latitude, each at the same distance from the terrestrial equator as the celestial tropics are from the celestial equator. The one north of the equator is called the tropic of Cancer, and that south of the equator the tropic of Capricorn. TRUCK'-SYSTEM, *n.* The practice of paying the wages of workmen in goods instead of money. This practice prevailed, particularly in the mining and manufacturing districts. The masters established warehouses or shops, and the workmen in their employment either got their wages accounted for to them by supplies of goods from such *depôts*, without receiving any money, or they got the money on a tacit or express understanding that they were to resort to the warehouses or shops of their masters for such necessities as they required. The ostensible design of this system was to supply the workmen and their families with provisions, clothing of good quality, &c., at the cheapest rate, and thus to leave them but little money for the purposes of drinking and idleness. The truck system, however, was liable to great abuses. It gave rise to unfair dealing, and a species of tyranny; the workmen had often to pay exorbitant prices for their goods, and from the great facility afforded to them of procuring liberal supplies of goods in anticipation of wages, they were led into debt. These, and other evils incident to the truck system, induced the legislature to put a stop to it by an act passed in 1831.

There being no appearance above ground to indicate the existence of the truffle, which lies concealed some inches under the surface of the clayey sandy soil, dogs are trained to discover these productions by the scent. It consists of a folded tube, generally of brass, but sometimes of silver, with a large bell-shaped aperture at one end for the emission of the sound, and a mouth piece at the other, adapted for blowing into the instrument with the mouth. The natural scale of the trumpet is limited, but by means of slides and keys, the number of notes may be greatly increased. It is the loudest of all portable wind instruments, and from its exciting effect, is well adapted for military music. It is used also for giving signals, and accompanies flags of truce, heralds, &c.

The *trumpet's* loud clangor

Excites us to arms.

Dryden.

Speaking trumpet, an instrument for increasing the intensity of articulate sounds, and transmitting them to considerable distances in a particular direction. It is constructed of various forms, but usually consists of a tin or copper tube from six to twelve or more feet long, of such a form that its diameter becomes greater towards the extremity furthest from the mouth. The mouth piece is made large enough to admit both lips. Philosophers are not agreed as to the best form of the speaking trumpet, as the theory of the instrument is attended with considerable difficulty. The sound which the trumpet conveys in one direction is supposed to be increased not so much from its being prevented from spreading in all directions, as by repeated reflections of the sound from the sides

of the trumpet. The speaking trumpet is chiefly used at sea.—*Ear trumpet*. [See among the compounds of **EAR**.]—*Trumpet marine*, an old musical stringed instrument. to prevent the rafters from sagging there are inserted the struts *d, d*. It is

obvious that the office of the beam *a, a*, and of the king post *b*, could be perfectly fulfilled by a string, as they both serve as ties. There are other forms of truss suited to different purposes, but the conditions are the same in all, viz., the establishing of fixed points to which the tie beam is *trussed*. Thus, in fig. 2, two points *a, a*, are substituted for the single one, and two suspending posts are required. These are called

The Saxon has *trusian*, to trust, to obligate. Qu. Gr. *ἰσχυρα*.] 1. Confidence; a reliance or resting of the mind on the integrity, veracity, justice, friendship, or other sound principle of another person.

A special trust is where property is vested in a trustee for purposes particularly pointed out, and where consequently the trustee is bound to the active performance of certain duties. Special trusts are farther subdivided into *ministerial* and *discretionary*, the former requiring for

their performance only the ordinary qualities of a rational agent; the latter requiring more or less of judgment and discretion. Trusts may be created by the voluntary act of a party, or by the operation of law. [See *USES*.] In *Scots law*, the term trust bears the same general signification as in English law, but in regard to the modes of constituting trusts, and the forms and technicalities connected therewith, the laws of the two kingdoms differ materially. For example, by the law of Scotland, a trust affecting heritage must be constituted by a formal disposition of the trustor, called a *trust-deed*, and completed by sasine of the heritage; whereas by the law of England, trusts of a like kind are not required to be declared or created by writing, but only manifested and proved by writing, and the law is satisfied if the trust be manifested by any subsequent acknowledgment on the part of the trustee, however informal or indirect, as by a letter under his hand, his answer in Chancery, or by a recital in a deed, &c., and though the writing itself must be signed, the terms of the trust may be collected from a paper not signed, provided it can be clearly connected with the signed writing.

That is, it is a truth; what you have said, I admit to be true. According to Dr. Reid, the truths that fall within the compass of human knowledge, whether they be self-evident or deduced from those that are self-evident, may be reduced to two classes, namely, *necessary and immutable truths*, and *contingent and mutable truths*. A necessary truth is one that depends not upon the will and power of any being; it is immutably true, and its contrary impossible. A contingent truth is one which depends upon some effect of will and power, which had a beginning and may have an end. Of the first class are the axioms in mathematics, and all the conclusions drawn from them; that is, the whole body of the science of mathematics. Some first principles, also, belonging to other sciences, are necessary truths; such as the following:—That every proposition must either be true or false; that the qualities which we perceive by our senses must have a subject, which we call body; and that the thoughts we are conscious of must have a subject, which we call mind; and that, whatever begins to exist, must have a cause which produced it. To the second class of truths, viz., those that are contingent, belong the truths of natural philosophy, which depend upon the will of the Maker of the world, and also the principles from which they are deduced. In short, all those truths that express matters of fact or real existences, depending upon the will and power of the Supreme Being, are contingent, with exception of his own existence and nature, which is a necessary truth.—*First truths*, first or fundamental principles; intuitive articles of belief, which form the foundation of all reasoning.—*In truth*, in reality; in fact.—*Of a truth*, in reality; certainly.—*To do truth*, is to practice what God commands; John iii.

The Indians of the Middle and Western States prefer this tree for their canoes, which are made of a single trunk. The bark, especially of the roots, has an aromatic smell and bitter taste, and has been used in medicine as a tonic and febrifuge. In this country the tulip tree is cultivated as an ornamental tree. TUMOUR, *n.* [L. from *tumeo*, to swell.] 1. In *sur.*, a swelling; a morbid enlargement of any part of the body. This is a word of very comprehensive signification, and it is very difficult to define exactly the diseases commonly classed under the name of *tumours*. According to some, a tumour is the

morbid enlargement of a particular part, without being caused by inflammation, a swelling which arises from inflammation being termed *tumefaction*. According to others, a tumour is any swelling which arises from the growth of distinct superfluous parts or substances, which did not make any part of the original structure of the body, or from a morbid increase in the bulk of other parts, which naturally and always existed in the human frame. The term *tumour* is limited, by Abernethy, to such swellings as arise from new productions, and includes only the *sarcomatous* and *encysted* tumours. An *encysted tumour* is one which is formed in a membrane called a *cyst*, connected with the surrounding parts by the neighbouring cellular substance. There are also fatty tumours, called *lipomatus* or *adipose* (*adipose sarcoma*), formed by an accumulation of fat in a limited extent of the cellular substance. Another division of tumours, considered as morbid parasitic growths, is into *malignant* and *innocent*. A *malignant tumour* is one which, after being removed by operation, is likely to recur in the same or some other part, while an *innocent tumour* is one which is not likely to recur after being removed by operation. Those tumours which are termed *tuberculous*, *medullary*, and *cancerous*, belong to the former class; and those termed the *common vascular*, the *adipose*, and the *pancreatic*, to the latter.—2. Affected pomp; bombast in language; swelling words or expressions; false magnificence or sublimity. [Little used.]

In the most ancient tumuli, bodies are found deposited within a stone receptacle, with the head towards the north. The bones which have been discovered within those tumuli which have been opened, are generally accompanied by utensils, weapons, &c. In some tumuli urns only have been found; in others, both bodies and urns, and in some the bones of animals. The tumuli found in this country are supposed to be of British construction. Those found in Roman camps appear to have been intended to serve for land marks, or some military purpose. [See *BARROW*.]

TUN, *n.* [Sax. *tunna*, a cask; Fr. *tonne*, *tonneau*; Ir. *tonna*; Arm. *tonnell*; G. *tonne*; D. *ton*; W. *tynell*, a barrel or tun. TUNGSTEN, *n.* [Sw. and Dan. *tung*, heavy, and *sten*, stone, heavy stone, or ponderous ore, so named from the density of its ores.] 1. A metal discovered by D'Elhuyart in 1781. It has a greyish white colour, and considerable lustre. It is brittle, nearly as hard as steel, and less fusible than *manganese*. Its specific gravity is 17.4. When heated to redness in the open air, it takes fire, and is converted into *tungstic acid*, and it undergoes the same change by the action of nitric acid. Digested with a concentrated solution of pure potash, it is dissolved with disengagement of hydrogen gas, and tungstate of potash is generated. The ores of this metal are the native tungstate of lime, and the tungstate of iron and manganese, which latter is also known by the name of Wolfram, and the same name is also given to the metal. Tungsten may be procured in the metallic state, by exposing tungstic acid to the action of charcoal or dry hydrogen gas at a red heat, but an exceedingly intense heat is required for fusing the metal. With oxygen, tungsten forms two compounds, the dark brown oxide, and the yellow acid of tungsten. With chlorine gas it forms two chlorides, a bichloride, and a trichloride. Both are red, volatile, and crystallizable compounds, subliming in beautiful crystals.—2. An obsolete name for the native tungstate of lime.

TUNGSTENIC, *† a.* Pertaining to or procured from tungsten.

TUNGSTIC ACID, *n.* An acid composed of one equivalent of the metal tungsten, and three equivalents of oxygen. It is obtained by heating the brown oxide of tungsten to redness in open vessels, and it may also be obtained from the native tungstate of lime, and from Wolfram. It is a yellow powder, insoluble in water. With bases it forms crystallizable salts. When exposed to the action of hydrogen gas at a temperature of 500° or 600°, it becomes of a fine deep blue, and is converted into the blue oxide of tungsten, which is regarded as a tungstate of tungsten.

TUNGSTO SULPHURETS. Compounds of tungsten and sulphur. They have no peculiar interest.

TUNIC, *n.* [Fr. *tunique*; L. *tunica*. See *TOWN* and *TUN*.] 1. A garment worn by the Romans of both sexes under the toga, and next to the skin. It was a kind of vest, generally of wool, of a white colour, and, as worn by men, came down a little below the knees before, and to the middle of the legs behind. It was fastened by a girdle or belt about the waist, to keep it tight when they went abroad, the girdle also serving as a purse, in which they kept their money. The tunic was at first worn without sleeves, but afterwards sleeves came to be used with fringes at the hands. The senators had a broad stripe of purple (called *latus clavus*) sewed on the breast of their tunic, and the equites had a narrow stripe (called *angustus clavus*) on the breast. Hence the terms *laticlavii* and *angusticlavii*, applied to persons of these orders. The tunic worn by women had sleeves, and reached down

to the feet.—2. In the *Roman catholic church*, a long undergarment worn by the officiating clergy.—3. A garment worn under the coat of mail.—4. TUNING, *n.* The art or operation of adjusting the various sounds of a musical instrument, so that they may be all at due intervals, and the scale of the instrument brought into as correct a state as possible. In tuning an instrument, the first point is to fix upon some one note as a leading note, and then by the pitch of it to determine the relative sounds of all the rest.—2. The art or operation of adjusting two or more musical instruments, so as to bring them into agreement with each other, as two or more violins, a violin and violoncello, &c. Horns, fifes, flutes, &c., have a permanent relative scale, and only change their pitch by change of temperature. [See **TEMPERAMENT**.]

The tunnies, like the mackerel, appear in great shoals or banks, and their approach is perceived by the fishermen at a considerable distance, from the noise which accompanies their rapid movements. The tunny attains to a large size, weighing sometimes a thousand pounds. The flesh somewhat resembles veal, is delicate, and has been in request from time immemorial. The art or operation of giving circular and other forms to bodies, as wood, metal, bone, ivory, &c., by making them revolve in various manners in a machine called a lathe, and applying cutting instruments so as to produce the form required; or by making the cutting instrument revolve when the substance to be operated upon is fixed. The art of turning is of immense importance to the practical mechanic, and in the whole range of manufactures, whether of articles of necessity, utility, ornament, or luxury, there is no art so generally applied. At the same time, there is probably no art in the range of mechanical operation susceptible of greater accuracy, and there is none which has so much contributed to the improvement of machinery. The lathe is a most wonderful contrivance, especially when we take into account all the improvements it has undergone, from its simplest and most ancient form in the potter's wheel, to that adaptation of varied and complex mechanism, by which, not merely cir-

cular turning of the most beautiful and accurate description, but exquisite figure-work, and complicated geometrical designs, depending upon eccentric and cycloidal movements, are produced. In ordinary turning, the body operated upon is made to revolve on a stationary straight line, as an axis, and a cutting tool applied to its surface in such a way, as, in the circumvolutions of the object, to cut off those parts which lie farthest from the axis, and make the outside of the substance concentric with the axis. In this case any section of the work made at right angles to its axis will be of a circular figure; but there are methods of turning several other curves in a variety of ways. Lathes are made in a great variety of forms, and put in motion by different means. They are called *centre lathes*, when the work is supported at both ends; *mandrel, spindle, or chuck-lathes*, when the work is fixed only at one end. There are also *pole lathes*, and *turn-bench lathes*, which resemble each other; *foot-lathes*, which are moved by the foot; *bar-lathes*, &c. Lathes for great works are moved by horses and water-wheels, but more generally by steam-engines. The largest columns, the most ponderous artillery, the minutest pivots of watch-work, wheel-work, rotatory machines, vessels, &c., are executed by means of the lathe.

In its wild state, it is a native of Great Britain, found in the borders of fields and waste places; but by cultivation the size of the plant, especially of the tuber or underground stem, is greatly increased. There are many varieties of the turnip cultivated for the table, and also in the fields. Those grown by farmers may be arranged as *whites* and *yellows*. The Swedish turnip is the *Brassica campestris rutabaga*. The young leaves and buds of the turnip are gathered and eaten under the name of *turnip tops*; the tubers consist of a large mass of soft cellular tissue, in which starch and sugar are deposited. Their great importance as food for cattle is well known, and turnips and clover are the two main pillars of the best courses of British husbandry. U.

U IS the twenty-first letter and the fifth vowel in the English Alphabet. Its true primary sound in Anglo-Saxon, was the sound which it still retains in most of the languages of Europe; that of *oo* in *cool*, *tool*, answering to the French *ou*, in *tour*. This sound was changed, probably under the Norman kings, by the attempt made to introduce the Norman French language into

common use. However this fact may be, the first, or long and proper sound of *u*, in English, is now not perfectly simple, and it cannot be strictly called a *vowel*. The sound seems to be nearly that of *eu*, shortened and blended. This sound, however, is not precisely that of *eu* or *yu*, except in a few words, as in *unite*, *union*, *uniform*; the sound does not begin with the distinct sound

of *e*, nor end in the distinct sound of *oo*, unless when prolonged. It cannot be well expressed in letters. This sound is heard in *annuity*, *numerate*, *mute*, *dispute*, *duke*, *opportunity*, *infusion*. Some modern writers make a distinction between the sound of *u*, when it follows *r*, as in *rude*, *truth*, and its sound when it follows other letters, as in *mute*, *duke*; making the former

sound equivalent to *oo*; *rood, trooth*; and the latter a diphthong equivalent to *eu* or *yu*. The difference, very nice indeed, between the sound of *u* in *mute*, and in *rude*, is owing entirely to the articulation which precedes that letter. For example, when a labial, as *m* or *p*, precedes *u*, we enter on its sound with the lips closed, and in opening them to the position required for uttering *u*, there is almost necessarily a slight sound of *e* formed before we arrive at the proper sound of *u*. When *r* precedes *u*, the mouth is open before the sound of *u* is commenced. [See INTRODUCTION, p. lii.] In some words, as in *bull, full, pull*, the sound of *u* is that of the Italian *u*, the French *ou*, but shortened. This is a vowel. *U* has another short sound, as in *turn, run, sun, turn, rub*. This also is a vowel. *U* and *V* were long used indiscriminately, the one for the other, but since the beginning of the 16th century they have been separated, *U* being considered as a vowel, and *V* a consonant. In abbreviations, *U. S.* stand for *United States*; *ult.* for *ultimo*, in the last month being understood. As a Latin abbreviation, *U. C.* stand for *Urbe condita*, the city having been built, that is Rome: thus *U. C.* 400 signifies 400 years after the building of Rome.

The last into which a substance can be resolved; constituent.—*Ultimate analysis*, in *chem.*, is the resolution of a substance into its absolute elements; opposed to *proximate analysis*, or the resolution of a substance into its secondary elements. Thus, when the analysis consists only in determining the simpler constituents of a compound, it is *proximate*, as when

carbonate of potash is separated into carbonic acid and potash; but when the operation is extended, and the carbonic acid is resolved into carbon and oxygen, and the potash into potassium and oxygen, the analysis is ultimate; for neither carbon, oxygen, nor potassium is resolvable into two or more kinds of matter; they are therefore to be considered as *ultimate* elements, or constituents. The terms *ultimate analysis*, and *ultimate elements*, are most generally used in reference to organic products. In inorganic analysis, the proximate elements are the substances generally sought, and the elementary composition of these being already known, the ultimate elements of which the substance analyzed is composed are also ascertained.—*Prime and ultimate ratios*. ULTRAMARINE, *n.* [supra.] A beautiful and durable sky-blue; a colour formed of the mineral called lapis lazuli. This substance is much valued by painters, on account of the beauty and permanence of its colour, both for oil and water painting. According to Gmelin of Tubingen, sulphuret of sodium is the colouring principle of lapis lazuli, to which the colour of ultramarine is owing. He has succeeded in preparing artificial ultramarine by heating sulphuret of sodium with a mixture of silicic acid and alumina. Artificial ultramarine thus prepared is sold in Paris at a moderate price. The finer specimens are quite equal to the native ultramarine, and much less ex-

pensive.—2. Azure-stone.—*Ultramarine ashes*, an inferior sort of a pigment which is the residuum of lapis lazuli, after the ultramarine has been extracted. Their appearance is that of the ultramarine, a little tinged with red, and diluted with white.

The tribe includes about ten genera, of which five are British, viz. Porphyra, Ulva, Tetraspora, Enteromorpha, and Bangia. [See PORPHYRA, and ULVA, the most important genera.]

When the primary pedicels have other smaller pedicels, which form of themselves a smaller umbel; as in Heracleum, Tæniculum, Daucus, &c., the umbel is said to be *compound*, and the smaller umbels are called *umbellules*. The whole assemblage of the umbels is called the *universal umbel*, and the secondary umbels or umbellules are called *partial umbels*. *Umbel* is sometimes called a *rundel*, from its roundness.

The plants of this order are natives chiefly of the northern parts of the northern hemisphere, inhabiting groves, thickets, plains, marshes, and waste places. They are herbs, seldom shrubs, with fistular furrowed stems. The leaves are in most cases divided; they are alternate, and all of them embrace or clasp the stem by a sheathing petiole. The flowers are white, pink, yellow, or blue, and are seated on umbels which are either simple or compound. The fruit consists of two carpels united by a common axis. The seed is pendulous, and contains a large quantity of albumen in proportion to the size of the embryo. The genera are very numerous, and the species extremely so, and difficult to recognize. Some are poisonous, as hemlock, fool's parsley, and others; others are esculents, as celery, carrots, and parsnips; many yield aromatics, as caraway, coriander, dill, anise; a few secrete a foetid gum-resin, much used in medicine, as assafoetida, galbanum, gum-ammoniacum, oppopanax, and sagapenum.

UN, a prefix or inseparable preposition, Sax. *un* or *on*, usually *un*, G. *un*, D. *on*, Sans. *an*, is the same word as the L. *in*. It is a particle of negation or of privation, giving to words to which it is prefixed a negative or privative signification. In adjectives it is interpretable by *not*, in nouns by the *want* or *absence of*; and in verbs and their passive participles it almost uniformly signifies the reversing or annulling of the action or state expressed by the verb. *Un* and *In* were formerly in many words, and in some still are used indiscriminately; but *Un* has, in numerous instances, more especially in words of Latin origin, given place to *In*. *Un* admits of no change of *n* into *l*, *m*, or *r*, as *in* does, in *illuminate*, *im-*

mense, irresolute. It is prefixed generally to adjectives and participles, and almost at pleasure; but this liberty may be carried too far. As the compounds formed with *un* are so common and so well known, the composition is not noticed under the several words. For the etymologies, see the simple words.

sometimes called *vibratory*; but *undulatory* seems to be most correct.—*Undulatory theory*, in *optics*, the hypothesis, according to which the phenomena of light are explained by the supposed vibrations or undulations of an ethereal medium, set in motion by the luminous body. This theory is opposed to the *theory of emanations*, or, as it is sometimes called, the *emission theory*, or *material theory*, according to which light is a material fluid of extreme subtilty. According to the former theory, the universe is filled with an ether or medium of great elasticity and rarity, which transmits light in the same manner as air transmits sound, and the impression is conveyed from the luminous body to the eye by successive undulations of this medium, occasioned by the luminous body; according to the latter theory, the luminous body constantly throws off material particles in every direction, which proceed in straight lines, and these particles falling upon the eye produce vision. Neither the undulatory nor material theory can be said to be satisfactorily established; but it would seem that every phenomenon which can be brought under the latter, can also, with equal facility, be explained by the former; while there are some known effects, as the phenomena of inflexion, in strict accordance with the former, which cannot, without great difficulty, and the introduction of gratuitous suppositions, be accounted for by the latter. Hence the undulatory theory has been more generally adopted in the investigations of modern philosophers.

Sounds of very different qualities and force may be in *unison*; as, the sound of a bell may be in *unison* with a sound of a flute. *Unison* then consists in sameness of degree, or similarity in respect to gravity or acuteness, and is applicable to any sound, whether of instruments or of the human organs, &c.—2. UNIT, *n.* [*L. unus*, one; *unitas*, unity.]

1. One; a word which denotes a single thing or person.—2. In *arith.*, the least whole number, or one, represented by the figure 1. Every other number is an assemblage of units. This definition is applicable to fractions as well as to whole numbers. Thus, the fraction $\frac{7}{10}$ is an assemblage of seven units, each of which is one-tenth of the integer.

Units are the integral parts of any large number. *Watts.*

3. In *math.*, any known determinate quantity, by the constant repetition of which, any other quantity of the same kind is measured; or it is the name given to that magnitude, which is to be considered or reckoned as one, when other magnitudes of the same kind are to be measured. It is not itself one, but is the magnitude which one or 1 shall stand for in calculation; it is a length, or a surface, or a solid, or a weight, or a time, as the case may be, while 1 is only a numerical symbol. This symbol 1 represents the abstract conception of singleness, as distinguished from multitude, and is the unit of abstract arithmetic: but all concrete quantities must have units of their own kind.—*Measuring unit*, in *mensuration*, a certain dimension or magnitude, assumed as a standard by which other dimensions or magnitudes of the same kind are to be measured.

Thus, in mensuration of surfaces, the measuring unit is a square inch, a square foot, a square yard, &c., and the area or superficies of any figure is estimated by the number of squares of this kind that are contained in it. In solids, the measuring unit is a cubical inch, a cubical foot, a cubical yard, &c., and the content or solidity of any figure is estimated by the number of cubes of this kind which it contains. In like manner, in linear measure, the measuring unit is an inch, a foot, a yard, &c.—

Unit of time, in *theoretical mech.*, one second, and all motion is measured by the space which is, or would be, passed over in this time; hence the velocity of a body signifies the space which it passes over in one second, and where one body is said to have a greater or a less velocity than another, it is meant that a greater or less space is passed over by it in one second.—*Unit of force or of weight*, in *theoretical mech.*, a certain force or weight assumed as a standard, by which other forces or weights, or their effects, may be estimated. This unit may be an ounce, a pound, a hundredweight, &c. [*See* UNITV.]

UNITABLE, *a.* Capable of being united.

UNITARIAN, *n.* [*L. unitas, unus*.] The

Unitarians are a sect of religionists who confine the glory and attribute of divinity to the one only great and supreme God, and Father of our Lord Jesus Christ. The Unitarians are opposed to the Trinitarians, or those who conceive of one God in three persons, characters, or relations, each of which they regard as the proper object of religious worship. The Unitarian Christian believes the Father to be the only true God, and Jesus, his messenger, to be the Christ. This is the leading fundamental principle, which constitutes the true and complete definition of the term Unitarian; under which are consequently included all those who, receiving the divine authority or commission of Jesus Christ, believe him to be a dependent creature, deriving his existence from the Father, and therefore the fit object of all the veneration, submission, and obedience which can be offered to a creature, but not of religious worship, properly so called. Agreeing in this great and leading principle; Unitarians differ in their opinions as to the origin, nature, and dignity of Jesus Christ. One division of them has received the name of Arians, another that of Socinians.

To join; to connect in a near relation or alliance; as, to *unite* families by marriage; to *unite* nations by treaty.—3. To make to agree or be uniform; as, to *unite* a kingdom in one

Generally speaking, they adhere to the confession of Augsburg, considering it as founded on the Scriptures, which are the only rule of their faith and practice. The Moravians are remarkable for a meek, quiet, and child-like spirit, and for their earnest and unremitting labours in attempting to convert the heathen.

Hence the use of this jar is to announce the number of such discharges, from which an estimate may be formed of the amount of electricity which passes into the larger jar or battery.

UNITY, *n.* [*L. unitas*.] 1. The state of being one; oneness. *Unity* may consist of a simple substance or existing being, as the soul; but usually it consists in a close junction of particles or parts, constituting a body detached from other bodies. *Unity* is a thing undivided itself, but separate from every other thing.—2. 5. In *math.*, the abstract expression for any unit whatsoever. The terms *unit* and *unity* are often used synonymously.

monly, but in general, the number 1 is *unity* when it is not applied to any particular object; and a *unit*, when it is so applied. [See UNIT, No. 3.]—6. In *poetry*, the principle by which a uniform tenor of story and propriety of representation is preserved. In the *Greek drama*, the three unities required were those of *action*, of *time*, and of *place*; in other words, that there should be but one main plot; that the time supposed should not exceed twenty-four hours, and that the place of the action before the spectators should be one and the same throughout the piece. In the epic poem, the great and almost only *unity* is that of action.—7. In *music*, such a combination of parts as to constitute a whole, or a kind of symmetry of style and character.—8. In *all the arts*, the correspondence of the various parts of a work, so that they may form one harmonious whole. *Unity* is indispensable in every work of art.—9. In *law*, the properties of a joint estate are derived from its *unity*, which is fourfold; *unity of interest*, *unity of title*, *unity of time*, and *unity of possession*; in other words, joint-tenants have one and the same interest, accruing by one and the same conveyance, commencing at the same time, and held by one and the same undivided possession.—10. In *law*, *unity of possession* is a joint possession of two rights by several titles, as when a man has a lease of land upon a certain rent, and afterward buys the fee simple. This is a *unity of possession*, by which the lease is extinguished.—*Unity of faith*, is an equal belief of the same truths of God, and possession of the grace of faith in like form and degree.—*Unity of spirit*, is the oneness which subsists between Christ and his saints, by which the same spirit dwells in both, and both have the same disposition and aims; and it is the oneness of Christians among themselves, united under the same head, having the same spirit dwelling in them, and possessing the same graces, faith, love, hope, &c.

UNIVALVE, *a.* [L. *unus*, one and *valvæ*.] Having one valve only, as a shell or pericarp.

UNIVALVE, *n.* A shell having one valve only. The *univalves* form one of the three divisions into which shells were divided by Linnæus, the other two divisions being bivalves and multivalves. In this arrangement the generic characters reside in the shell and not in the structure of the inhabiting animal. Modern naturalists have adopted a much more scientific system of arrangement in regard to testaceous or molluscous animals. Lamarck divides the bivalves into five orders, viz., Heteropoda, Cephalopoda, Trachelipoda, Gasteropoda, and Pteropoda. Univalves are far more numerous than either multivalves or bivalves, both in genera and species.

[See JOINT.]—*Universal proposition*, one in which the subject is taken in its widest extent, and the predicate applies to every thing which the subject can denote. Thus, "all men are mortal," is a *universal proposition*, and also, "no man is perfect." A *universal proposition* is opposed to a *particular proposition*, or one which makes such an assertion or denial of some of the things spoken of, as implies that others are left unspoken of: Thus, "some men are born in England," and "some animals cannot live in this climate," are *particular propositions*. [See the Noun.]

UNIVERSAL, *n.* [See the Adjective.] In *logic*, a *universal* is *complex* or *incomplex*. A *complex universal*, is either a *universal proposition*, as "every whole is greater than its parts," or whatever raises a manifold conception in the mind, as the definition of a reasonable animal. An *incomplex universal*, is what produces one conception only in the mind, and is a simple thing respecting many; as *human nature*, which relates to every individual in which it is found.—2. † The whole; the general system of the universe.—*Universals*, the name given by the schoolmen to general notions or ideas, especially those of genera and species.

UNIVERSITY, *n.* [L. *universitas*, the whole of any thing as contrasted with its parts; a community, association, corporation, company, &c.] In the modern sense of the term, an establishment or corporation for the purposes of instruction in all or some of the most important divisions of science and literature, and having the power of conferring certain honorary dignities, termed degrees. The term *university*, like many other terms of extensive application, has undergone various modifications of meaning, till its origin and primary use seem to have been utterly forgotten. In its proper and original meaning, it denotes the whole members of an incorporated body of persons, teaching and learning one or more departments of knowledge. In the technical language of the civil law, the word *universitas* was used to signify a plurality of persons, associated for a continued purpose, and may be rendered by *society*, *company*, *corporation*. In the middle ages, the term was used in reference to seminaries of learning, to denote either the whole body of teachers and learners, or the whole body of learners, with corporate rights and under bye-laws of their own, divided either by faculty or by country, or both together; its meaning being determined by the words with which it was connected. At a later period, the expression *universitas literarum* was used to indicate that all the most important branches of science were to be taught in these establishments; but although it is true that most of the modern universities embrace the whole circle of learning, as contained in the four faculties of the arts, theology, law, and physic, this was not the case in the 12th century, when the term *universities* was first applied to academical institutions. The university of Paris, as well as Oxford and Cambridge, existed at first only in the faculty of arts, and Salerno and Montpellier contained the single faculty of medicine. Some, forming their notion of the word *university* merely from the English universities, suppose that it necessarily means a collection and union of colleges; that it is a great corporation embodying in one the smaller and subordinate collegiate bodies; but this is not correct, for many universities exist in which there are no colleges: This is the case with most of the German universities, and in the Scottish universities there are no foundations which bear any resemblance to the English colleges; and, besides, the universities of Oxford and Cambridge existed before a single college was endowed. The oldest of the European universities were those of Paris and Bologna, and these formed the models on which the other universities, which subsequently sprung up in various parts of Europe, were established.

URALIAN, *a.* Relating to the river Ural, or the Ural mountains, in Russia.

URAMILE, *n.* A new chemical compound discovered by Wöhler and Liebig. It is a product of the decomposition of thionuric acid, and is obtained either in the form of a crystalline powder, or in dendritic or feathery crystallizations, of a very beautiful aspect. It dissolves in ammonia and potash, and the solution absorbs oxygen, becoming purple, and depositing green crystals of murexide, or of potassium-murexide. Uramile may be considered as uric acid, in which the urea is replaced by 1 equivalent of ammonia, and 2 of water.

URAMILIC ACID, *n.* An acid obtained by Wöhler and Liebig, by evaporating acid thionurate of ammonia, or uramile, with dilute sulphuric acid. It appeared to those chemists as fine four-sided prisms, or silky needles, very soluble in water; but it has not again been obtained, and its existence is still doubtful.

URANIA, *n.* In *Grecian myth.*, the muse of astronomy. She is generally represented with a crown of stars, in

Urania, from an antique statue.

a garment spotted with stars, and holding in her left hand a celestial globe or a lyre. *Urania* is likewise the name of the heavenly Venus, or of pure intellectual love. One of the Oceanides, or sea-nymphs, was also called *Urania*.

—2. In *bot.*, a genus of plants; nat. order Musacæ. It has but one species, the *U. speciosa*, a native of Madagascar, with flowers similar to the Bananas, and leaves arranged in a fan-shape. The seeds are said to constitute a wholesome food. It may be ranked among the most splendid of our hot-house plants.

URANIC ACID, *n.* Peroxide of uranium.

URANITE, *n.* An ore or phosphate of uranium, called also uran-glimmer and uran-mica. Streak paler than the colour; colour emerald-green, grass-green, leek-green, golden-yellow, and

lemon-yellow; transparent or sub-translucent. It contains phosphoric acid, oxide of uranium, lime, silica, oxide of iron, with small quantities of magnesia, oxide of manganese and barytes, but it appears essentially to consist of the phosphates of uranium and lime. It occurs crystallized in rectangular prisms, in imperfect octahedrons, &c. Its structure is lamellar, and it yields to the knife. Uranite is found in veins of granite near Autun and Limoges, in France, and also in several parts of Saxony. A green variety, called chalcocite and uran-mica, is found in Cornwall. Its colour is owing to the presence of phosphate of copper instead of phosphate of lime.
 URANITE, *a.* Pertaining to uranite, or resembling it.

URANIUM, *n.* A metal discovered by Klaproth, in 1789, who named it after the planet Uranus, the discovery of which had occurred some years before. It was obtained from the mineral called *pechblende*, which consists of protoxide of uranium, and oxide of iron. It also occurs in the form of peroxide in uranite and uran-mica. Uranium appears to be of a crystalline texture, with a metallic lustre, and of a reddish-brown colour. It suffers no change from exposure to the air at common temperatures, but when heated in open vessels it absorbs oxygen, and is reconverted into the protoxide. The properties of this metal, however, are as yet known imperfectly, and, from recent researches, it would appear that what was supposed to be the metal is an oxidised body, acting, according to Péligot, the part of a metal; while, according to others, it is the protoxide of the true metal. The oxide of uranium, or what was formerly regarded as metallic uranium, is used for giving a fine black in painting on porcelain, and the peroxide and all its compounds have rich and permanent yellow colours.

URAN-MICA, *n.* Green uranite, or chalcocite. [*See URANITE.*]

URAN-O'CHRE, *n.* A yellow earthy incrustation, supposed to be the oxide of uranium, combined with carbonic acid, or a carbonate of uranium. It is also termed *uran-bloom* and *uraconise*. It occurs in silver-veins in Bohemia, forming a coating on *pechblende*. The same name is also applied to *pechblende*.

upwards. The mouth is turned up in a similar manner.

URANUS, n. [Gr. *ουρανός*, heaven.] In *myth.*, a divinity, the first king of the Atlantic nation, and the father of Saturn.—2. In *astron.*, one of the primary planets, discovered by Sir William Herschel in 1781. It was the remotest known planet belonging to our system, until the discovery of the planet Neptune in 1846. It presents the appearance of a small round uniformly illuminated disc, without rings, belts, or discernible spots. To the naked eye it appears like a star of the sixth magnitude, its apparent diameter being about four seconds. Its real diameter is 35,000 miles, so that its bulk is about eighty times that of the earth. It completes its revolution round the sun in nearly 84 of our years, moving in its orbit at the rate of 15,000 miles in an hour. Its distance from the sun is 180 million miles. Sir W. Herschel discovered six satellites about the planet Uranus. The existence of two of these has been clearly made out, but many have doubted the existence of the remaining four, as no one besides Herschel himself has ever been able to see one of them, except Mr. Lamont, of the observatory of Munich, who saw the sixth satellite in 1837. The orbits of the satellites of Uranus (at least of those two whose existence is certain), are nearly at right angles to the plane of the ecliptic, and their motions are retrograde, or from east to west, instead of from west to east, as is the case with every other planet and satellite. The name *Uranus* was given to this planet in allusion to the ancient mythology, according to which Uranus was the father of Saturn, as Saturn was of Jupiter, and Jupiter of Mars. It was also named Herschel in honour of the discoverer, and the Georgium Sidus, in honour of the reigning king, George III.; but the name Uranus is now universally recognised.

It is also prepared artificially and more easily from cyanate of ammonia. In its solid and pure state, urea crystallizes in four-sided prisms resembling nitre in appearance, and also in their taste, which is saline and cooling, exactly like that of nitre. It is soluble both in water and alcohol, and, when heated, it melts, gives off much ammonia, and finally solidifies, being in a great measure converted into ammonia and cyanuric acid. It belongs to the class of organic bases, forming crystallizable compounds with several acids, such as nitric, oxalic, and acetic acids. It consists of 2 atoms of carbon, 4 of hydrogen, 2 of nitrogen, and 2 of oxygen.

URIC ACID, n. [Gr. *ουρία*, urine.] An acid discovered by Scheele, and some-

times called *lithic acid*. It occurs in small quantity in the healthy urine of man and quadrupeds, and in much larger quantity in the urine of birds. The semi-fluid urine of birds and serpents is principally composed of urate of ammonia, and guano, which is the decomposed excrement of aquatic birds, contains a large quantity of urate of ammonia. Uric acid occurs in combination with soda or ammonia in those gouty concretions, commonly called *chalk-stones*, and it constitutes the principal proportion of the calculi, deposited in the human bladder, and of the red gravel or sand which is voided in certain morbid states of the urine. It is best obtained from the excrement of the boar constrictor. It crystallizes in fine scales of a brilliant white colour, and silky lustre; it is inodorous and insipid, heavier than water, and nearly insoluble in it when cold, and only slightly dissolved by it when hot; the solution reddens litmus paper, but feebly. Nitric acid dissolves uric acid, and also sulphuric acid, when concentrated. When it is dissolved in nitric acid, the solution contains alloxan, alloxantine, parabanic acid, and ammonia, and when evaporated, and treated with ammonia in excess, it acquires a purple red colour, a test by which uric acid may be recognised. It consists of 10 equivalents of carbon, 4 of nitrogen, 4 of hydrogen, and 6 of oxygen. It may be regarded as a compound of urile or cyanoxalic acid with urea. The saline compounds of uric acid are called *urates*, the most important of which are the urates of potash, soda, and ammonia.

URILE, } *n.* A radical supposed to
URYLE, } exist in the compounds of uric acid, and to be formed of the elements of cyanogen, and those of carbonic oxide. It is also called cyanoxalic acid.

URINE, *n.* [L. *urina*; Gr. *ουρον*, from *ουρος*: G. *harn*, *harnen*.] An animal fluid or liquor secreted by the kidneys, whence it is conveyed into the bladder by the ureters, and through the urethra discharged. In its natural state it is acid, transparent, of a pale amber or straw-colour, a brackish taste, a peculiar odour, and of a specific gravity varying from 1.012 to 1.030. The character of the urine, however, is apt to be altered by a variety of circumstances, and from the variety of the substances extracted from the body through the medium of the kidneys, the urinary system may be regarded as the emunctory of the entire animal economy, in which we meet with every principle and constituent that analysis has discovered, forming the solids and fluids of the body. A knowledge of the urine in health, and of the variations to which it is subject in disease, is of the utmost importance to the medical practitioner, as the different appearances of this fluid indicate not merely the state of the urinary system, but the changes which have taken place in other parts of the animal economy. According to Berzelius, 1000 parts of healthy urine contain:—water, 933 parts; urea, 30.1; uric acid, 1; free lactic acid, lactate of ammonia, and animal matters not separable from them, 17.14; mucus of the bladder, 0.32; sulphates of potash and soda, 6.87; phosphates of soda and ammonia, 4.59; muriate of soda, 4.45; muriate of ammonia, 1.50; earthy phosphates, with a trace of fluuate of lime, 1; silex, 0.03. In addition to these ingredients, urine occasionally contains a variety of other substances, as sugar bile, albumen, fibrin, fat, blood, &c. No liquor in the human body is so variable, in respect to quantity or quality, as the urine. It varies even in its healthy state in respect to age, drink, food, medicines, the time of the year, the muscular motion of the body, and the affections of the mind.

perfectly wild, savage, and untameable animal. According to ancient accounts, it was an animal of great size, with large, spreading, and acute horns. Some naturalists consider what they call the *Bos Scoticus*, or wild bull of Scotland, still preserved in a few parks, as belonging to this genus, but this animal is evidently a variety of the domestic ox.

Gentle *usage* will often effect what harsh *usage* will not. The elephant may be governed by mild *usage*.—2. Use, or long continued use; custom; practice. Uninterrupted *usage* for a long time, or immemorial *usage* constitutes prescription. Custom is a local *usage*; prescription is a personal *usage*. *Usage*, however, differs both from custom and prescription; no man may claim a rent, common, or other inheritance by *usage*, though he may by prescription. [See *PRESCRIPTION*.] In language, *usage* is the foundation of all rules.

Of things once received and confirmed by use, long *usage* is a law sufficient.

Hooker.

3 † Manners; behaviour.

In *com.*, a determinate time fixed for the payment of bills of exchange, reckoned either from the day of their date, or the day of their acceptance. It is thus called because this time is settled by *usage*, or the custom of places on which the bills are drawn. In France, the *usage* for bills drawn from Spain and Portugal is sixty days. At London, the *usage* for bills drawn from Holland, Germany, or France, is one month. The *usage* is very different in different countries and cities. *Double, treble, and half usage*, are terms implying corresponding alterations on the usual period.

USE, *n.* [L. *usus*; It. *uso*; Fr. *us*, plur.] 1. The act of handling or employing in any manner, and for any purpose, but especially for a profitable purpose; as, the use of a pen in writing; the use of books in study; the use of a spade in digging. Use is of two kinds; that which employs a thing without destroying it or its form, as the use of a book or of a farm; or it is the employment of a thing which destroys or wastes it, as the use of bread for provision; the use of water for turning a mill.—2. Employment; application of anything to a purpose, good or bad. It is our duty to make a faithful use of our opportunities and advantages for improvement.

Books can never teach the use of books.

O Cesar, these things are beyond all use.

[Unusual.] *Shak.*

8. Interest; the premium paid for the possession and employment of borrowed money.—9. In *law*, the benefit or profit of lands and tenements. Use imports a trust and confidence reposed in a man for the holding of lands. He to whose use or benefit the trust is intended, shall enjoy the profits. All modern conveyances are directly or indirectly founded on the doctrine of uses and trusts, which has been deemed the most intricate part of the property law of England. Uses and trusts, being acts of confidence reposed, are cognizable in equity, when coupled with the performance of any act tending to the benefit of the party for whose enjoyment the use or trust was created.

Uses, as a term, is applied to lands of inheritance, and the party to whose use they are conveyed has the absolute possession; as if land is conveyed to A, to the use of B, B has by law the possession vested in him; but if land be conveyed to A, to the use of B in trust, to permit C to enjoy and receive the profits of the land, B has the legal, C the equitable estate; the law transferring the use into possession, or as it is the more common mode, land is conveyed to A, to the use of A, in trust for B and his heirs, or to permit B to occupy, &c. Uses only apply to land of inheritance; no use can subsist of leaseholds.—*Statute of uses*, the Stat. 27 Henry VIII. cap. 10, which transfers uses into possession, or which unites the use and possession.—*Cestuy que use*, in law, the person who has the use of lands and tenements.—*Executed use*, one to which the statute applies by annexing it to the legal ownership.—*Springing use*, one limited to arise on a future event, where no preceding use is limited.—*Future or contingent use*, one limited to a person not ascertained, or upon an uncertain event, but without derogation of an use previously limited.—*Resulting use*, is one which, being limited by the deed, expires or cannot vest, and results or returns to him who raised it, after such expiration.—*Secondary or shifting use*, is that which, though executed, may change from one to another by circumstances.—*In use*, in employment; as, the book is now in use.—2. V.

V IS the twenty-second letter of the English Alphabet, and a labial articulation, formed by the junction of the upper teeth with the lower lip, as in pronouncing *av*, *ev*, *ov*, *vain*. It is not a close articulation, but one that admits of some sound. It is nearly allied to *f*, being formed by the same organs; but *v* is vocal, and *f* is aspirate, and this constitutes the principal difference between them. *V* and *u* were formerly the same letter, derived no doubt from the Oriental *vau* or *vauo*, but they have now as distinct uses as any two letters in the alphabet, and are therefore to be considered as different letters. The Roman letter *v* was probably pronounced as a *w*, a supposition which would explain the fact that in the alphabet of that language one character is employed for both *u* and *v*. *V* has one sound only,

as in *vary*, *vote*, *lavish*.—As a numeral, *V* stands for 5. With a dash over it, in old books, *V̄*, it stands for 5000. *V. R.*, among the Romans, stood for *ut rogas*, as you desire; *V. C.* for *vir consularis*; *V. G.* for *verbi gratia*; *V. L.* for *videlicet*. In modern abbreviations, *V.* stands for *vide*, see; also for *verb*, or *verse*; *viz.* for *videlicet*, that is to say, namely. In music for instruments, *V.* stands for *violin*; *V. V.* for *violins*. *V. S.* for *volta subito*, turn over quickly. In *her.*, *V.* is used to express *vert* or *green*, in the tricking or drawing of arms with a pen and ink.

VA'CUOUS, *a.* Empty; unfilled; void.

VA'CUOUSNESS, *n.* The state of being empty.

VA'CUUM, *n.* [*L.*] Space empty or devoid of all matter or body. Whether there is such a thing as an absolute vacuum in nature, is a question which has been much controverted. The existence of a vacuum was maintained by the Pythagoreans, Epicureans, and Atomists; but it was denied by the Peripatetics, who asserted that 'nature abhors a vacuum.' Descartes also denied the possibility of a vacuum, maintaining that the essence of matter consists in extension. Some philosophers have supposed that all space beyond the atmosphere of the earth and other planets, is filled with an ethereal fluid, far more fine and subtle than air. This latter opinion receives some countenance from recent observations. It has been all but proved that a comet undergoes precisely the same sort of changes in its mean motion, which would be produced if the body moved in a medium which offered a small resistance to its motion. The undulatory theory of light which is now pretty generally received, also furnishes an argument against the existence of a vacuum, for according to this theory the whole of the celestial spaces are filled with a medium of great elasticity. The term *vacuum*, is generally used to denote the interior of a close vessel, from which the atmospheric air, and every other gas have been extracted. Thus, in experiments with the air pump, the interior of the glass receiver, after the air has been extracted by the machine, is termed a vacuum. In this case, however, the vacuum is not perfect, for from the very nature of the machine, some air must always remain in the receiver, however long the exhausting process may be continued. The most perfect vacuum which can be produced artificially is the *torricellian vacuum*, or the space above the mercury in the barometer tube, but even here the vacuum is not absolutely perfect, for although the air may be entirely excluded from the space above the mercury, there is always an atmosphere of the vapour of mercury.—*In vacuo*, in a vacuum.

Prior.

In *law*, the word *vagrant* has a much more extended meaning than that assigned to it in ordinary language, and in its application the notion of wandering is almost lost. By the law *vagrants* are divided into three classes. 1. Idle and disorderly persons; 2. Rogues and

vagabonds; 3. Incurable rogues. Under the first class are included, every person who refuses or neglects to maintain himself and family, he being able to do so; paupers returning without certificate to parishes from which they have been legally removed; pedlars without license, beggars, common prostitutes, &c. Under the second class, are included every person committing any offence which would constitute him an idle or disorderly person, and who has been once already convicted, fortune tellers, and other impostors; persons guilty of indecent exhibitions; persons collecting alms or money under false pretences; wanderers who have no visible means of subsistence, and cannot give a good account of themselves; persons playing at games of chance in public places; reputed thieves; persons having in their possession housebreaking implements or offensive weapons with intent to use them. Under the third class are included persons guilty of the last class of offences, having been already convicted; persons breaking out of legal confinement; every person apprehended as a rogue and vagabond, and violently resisting any constable or other peace officer, so apprehending him. For all these offences the punishment is imprisonment or hard labour for a longer or shorter period, according to the nature of the particular offence. In *Scotland*, the laws against *vagrants*, as beggars, fortune tellers, jugglers, minstrels, &c., are of a much less stringent nature, and such persons are seldom apprehended or punished, unless where police regulations are enforced, or where they are entering a parish in the face of an advertised prohibition, or where they are committing or in the notorious habit of committing petty delinquencies.

which are numerous, are shrubs, or undershrubs, with very variable leaves, and mostly reddish-white corymbose flowers. Twelve species are European, and four are British. These plants are found in abundance in many districts, both of the old and new world.

V. officinalis, the official or great wild valerian, is a native of Europe, and grows abundantly by the sides of rivers, and in ditches, and moist woods, in Great Britain. The root, which is the official part, has a very strong smell, which is dependent on a volatile oil. Cats and rats are very fond of it, and rat-catchers employ it to decoy rats. It is used in medicine in the form of infusion, decoction, or tincture, as a nervous stimulant and antispasmodic. For a figure of this plant, see *Triander*. *V. rubra*, or red valerian, is occasionally found wild in Britain, and is cultivated in gardens as well as many other species, on account of its elegant flowers. *V. phu* is the garden valerian, and *V. discoroidis* the ancient Greek valerian.

The principal genera are *Valeriana*, *Valerianella* (the *Fedia* of Adamson), and *Nardostachys*, or spike-nard. The name *valerian* is given to *Polemium caruleum*.

VALERIANEL'LA, *n.* A genus of plants; nat. order Valerianaceæ. The species of this genus have been described by Smith, Hooker, and others, under the Adansonian genus *Fedia*; but Decandolle, Lindley, and other systematic botanists, retain *valerianella*, which is a diminutive of *valeriana*, and restrict the genus *Fedia* to a single species, the *F. cornucopia*. Four species of *valerianella* are British. *V. olitoria*, common corn-salad, or labih's lettuce, is an annual plant, found abundantly in corn fields and cultivated ground in Great Britain. VALUE, *n.* (val'u.) [Fr. *valoir*, *valu*; from L. *valor*, from *valeo*, to be worth; It. *valore*; Sp. *valor*.] 1. Worth; that property or those properties of a thing which render it useful or estimable; or the degree of that property or of such properties. The *real* value of a thing is its utility, its power or capacity of procuring or producing good. Hence, the *real* or *intrinsic* value of iron is far greater than that of gold. But there is, in many things, an *estimated* value, depending on opinion or fashion, such as the *value* of precious stones. The *value* of land depends on its fertility, or on its vicinity to a market, or on both.—2. Price; the rate of worth set upon a commodity, or the amount for which a thing is sold. We say, the *value* of a thing is what it will bring in

market.—3. In *political economy*, the quantity of labour, or of the product of labour, which will exchange for a given quantity of labour, or of some other product thereof. It is the labour of man alone which in ordinary circumstances creates value, and becomes the real measure of the exchangeable value of all commodities. It is necessary here to distinguish utility from value, or, as Adam Smith expresses the distinction, "*value in use*" from "*value in exchange*." The former may be defined, the power or capacity of an article to satisfy our wants or gratify our desires, while the *value in exchange* is that which will be received as an equivalent for something else which it has taken some labour to produce or obtain. What all may enjoy alike without labour may indeed be most useful and necessary, but cannot be an object of exchange, and therefore is destitute of value. Water is indispensable to existence, and has therefore a very high degree of utility or of *value in use*; but as it can generally be obtained in large quantities without much labour or exertion, it has, in most places, but a very low value in exchange. Gold, on the contrary, is of comparatively little utility; but as it exists only in limited quantities, and requires a great deal of labour on its production, it has a comparatively high exchangeable value, and may be exchanged or bartered for a proportionally large quantity of most other things. The real value of a commodity depends solely upon the quantity of labour necessary for its production, and the exchangeable value never varies materially either above or below the real value; hence it follows that the price paid for labour does not affect the exchangeable value of articles produced under similar circumstances. Every reduction in the quantity of labour required to produce a commodity diminishes its real value, and hence its value in exchange; and, upon the same principles, every increase in the quantity of labour, directly or indirectly applied, adds to the value of a commodity.—4. Worth; *applied to persons*.

Ye are all physicians of no *value*; Job xiii.
Ye are of more *value* than many sparrows; Matt. x.

5. High rate.
Cesar is well acquainted with your virtue,
And therefore sets this *value* on your life.

To rate at a high price; to have in high esteem; as, a *valued* poem or picture. A man is apt to *value* his own performances at too high a rate; he is even disposed to *value* himself for his humility.—3. To esteem; to hold in respect and estimation; as, to *value* one for his works or virtues.—4. To take account of.

2. In *mech.*, a kind of movable lid, or cover adapted to the orifice of a tube, or passage into a vessel, for the purpose of regulating the admission or escape of a fluid, such as water, gas, or steam. Some valves are self-acting, that is, they are so contrived as to open in the required direction, by the pressure of the fluid upon their surface, and immediately to shut and prevent the return of the fluid when the direction of its pressure changes. Others are actuated by independent external agency. Examples of the former kind are presented in the valves of pumps, and in the safety-valves of steam boilers, and of the latter, in the slide-valves appended to the cylinder of a steam engine for the purpose of regulating the admission and escape of the steam. The construction of valves admits of an almost endless variety. [*See CUR-VALVE, CLACK-VALVE, CONICAL VALVE, D-VALVE, SAFETY-VALVE, THROTTLE VALVE.*]

VAMP'IRE, *n.* [*G. vampyr.*] 1. According to Dom Calmet, the *vampire* is a dead man who returns in body and soul from the other world, and wanders about the earth doing every kind of mischief to the living. Generally he sucks the blood of persons asleep, and thus causes their death, while those who are destroyed in this manner become themselves vampires. The only way of getting rid of such visitors, is, according to the same author, to disinter their bodies, to pierce them with a stake cut from a green tree, to cut off their heads, and to burn their hearts. This superstition is chiefly prevalent in some parts of Eastern Europe, and especially in Hungary and its dependencies.—2. In *zool.*, the Linnean trivial or specific name of *Pteropus Edwardsii*, or the great bat of Madagascar; also, the popular name of *Phyllostoma spectrum*, or the *Vampyre bat* of New Spain; also, the popular name of the genus of *bats*, named

Vampyre (*Phyllostoma spectrum*).

Vampyrus. Bats of the genus *Phyllostoma* have a leaf-like appendage attached to their upper lip, whence their name. The tongue is capable of considerable extension, and is furnished at its extremity with a number of papillæ, apparently arranged so as to form an organ of suction. These animals grow to a great size, specimens having been killed measuring two feet between the tips of the wings. They attack horses and cattle, and sometimes even man, during the night, puncturing their skin, it is supposed, by means of the hooked nail of the thumb, and then abstracting the blood by the suctorial powers of their lips and tongue. In some parts of Brazil the ravages of these creatures

are such as to render the rearing of cattle an impossibility. It is more than probable, however, that the celebrated vampire superstition, and the blood-sucking qualities attributed to the bat, have some connection with each other.

VANA'DIATE, *n.* A salt formed by the union of vanadic acid with a base; as, *vanadate* of lead.

VANA'DIC ACID, *n.* An acid obtained by heating vanadate of ammonia so as to expel the alkali. Its colour in the state of fine powder is a light rust yellow; but when fused, it is red with a shade of orange, and has a strong lustre. It is tasteless, nearly insoluble in water, and quite so in alcohol. With bases it forms salts, which are either red or yellow, according as they are acid or neutral salts; but the neutral vanadates of the alkalies may occur both yellow and colourless, without any known difference in composition. Vanadic acid consists of 3 equivalents of oxygen, and 1 of vanadium.

VANA'DIUM, *n.* [from *Vanadis*, a Scandinavian deity.] A metal discovered by Sefström in 1830, in iron prepared from the iron ore of Taberg, in Sweden. It was afterwards obtained by the same individual in the slag formed during the conversion of the cast-iron of Taberg into malleable iron. It has since been found in a lead ore from Wanlockhead, in Scotland, and in a similar mineral from Zimapan, in Mexico. This metal has a white colour, and a strong metallic lustre, considerably resembling silver, but still more like molybdenum. It is extremely brittle. It is not oxydized either by air or water, though by continuous exposure to the atmosphere, its lustre grows weaker, and it acquires a reddish tint. The only acid that dissolves it is aqua regia. Oxygen and vanadium combine to form two oxides, viz., the protoxide, which is a black powder, having a semi-metallic lustre, and the deutoxide, which, when anhydrous, is also black, but forms blue salts. With chlorine, vanadium forms a bichloride, and a terchloride.

This point is situated always somewhere in an indefinitely extended line, supposed to be drawn on a level with the eye parallel to the horizon, and called from this circumstance the *vanishing line*. In

Vanishing point.

VAPOROUSNESS, *n.* State of being full of vapours.

VAPOUR, *n.* [*L. and Sp. vapor*; *Fr. vapeur*; *It. vapore.*] It is probably from a verb signifying to depart, to fly off.] 1. In a *general sense*, an invisible elastic aeriform fluid, into which any body naturally solid or liquid at ordinary temperature may be converted by the agency of heat, and which is capable of being condensed or brought back to the liquid or solid state, by reducing the temperature, or by a moderate increase of pressure. Vapours are distinguished from gases by their ready conversion into liquids or solids, whereas gases retain their elastic state more obstinately; they are always gaseous at common temperatures; and, with one or two exceptions, cannot be made to change their form, unless by being subjected to much greater pressure than they are naturally exposed to. Several of them, indeed, have hitherto resisted every effort to compress them into liquids. Different substances yield vapours with very different degrees of facility; fluids in general are more easily vaporized than solids, and solids generally pass into the liquid state before they assume the form of vapour. Some liquids, ether for instance, require to be carefully secluded from the atmosphere, to prevent their rapid conversion into vapour. The vapour which is produced by the ebullition of water is distinguished by the name of *steam*,—*which see*.—2. A visible fluid floating in the atmosphere. All substances which impair the transparency of the atmosphere, as smoke, fog, &c., are in common language called *vapours*.—3. In *meteorology*, that invisible elastic fluid which rises constantly from the surface of land and water all over the

world, at common temperatures, and which, uniting itself to the air, ascends into the higher regions of the atmosphere, and is carried by the winds to great distances. Aqueous vapour thus suspended in the atmosphere, when condensed by cold, becomes visible, forming clouds, and returning to the earth in the form of rain, snow, &c. The formation of vapour at the surface of land and water is promoted by an increase of temperature, by winds, and by the dryness of the atmosphere. When the atmosphere is already saturated with aqueous vapour, the formation of vapour goes on slowly. [See **EVAPORATION**.]—3. Substances resembling smoke, which sometimes fill the atmosphere, particularly in America during the autumn.—4. Wind; flatulence.—5. See VARY.*] That may vary or alter; capable of alteration in any manner; changeable; as, *variable* winds or seasons; *variable* colours.—2. Susceptible of change; liable to change; mutable; fickle; unsteady; inconstant; as, the affections of men are *variable*; passions are *variable*. His heart I know, how *variable* and vain.

Milton.

Variable quantities, in *analysis*, are such quantities as are subject to continual increase or diminution, in opposition to those which are *constant*, remaining always the same. Thus, the abscissas and ordinates of a curve are *variable quantities*; because they vary or change their magnitudes together, and in passing from one point to another, their values increase or diminish according to the law of the curve. *Variable quantities* are usually denoted by the last letters of the alphabet, *z, y, x*, while those that are constant are denoted by the first letters, *a, b, c*. In the investigation of the relation which varying and dependent quantities bear to each other, the conclusions are more readily obtained by expressing only two terms in each proportion, than by retaining the four; but it must be kept constantly in mind that four quantities in the shape of a proportion are always understood; namely, each of the two *variable quantities* at different periods of their increase or decrease. One quantity is said to *vary directly* as another, when the two quantities depend wholly upon each other, and in such a manner that if one of them be increased or diminished, the other is increased or diminished in the same proportion. Thus, if the altitude of a triangle be invariable, the area varies directly as the base; for if the base be increased or diminished, the area is increased or diminished in the same proportion. One quantity is said to *vary inversely* as another, when the former cannot be changed in any manner, but the reciprocal of the latter is changed in the same proportion. For example, if the area of a triangle be given, the base varies inversely as the perpendicular altitude. Thus, if *A* denote the altitude of a triangle whose area is given, and *B* its base, then *A* varies as $\frac{1}{B}$, or $A \propto \frac{1}{B}$.

One quantity is said to *vary as two others jointly*, when it increases or decreases as the product of those two quantities increases or decreases. For example, the area of a triangle varies as its base and altitude jointly; thus, if *A* denote the area of a triangle, *B* its base, and *C* its altitude, then *A* varies as *B C*, or $A \propto B C$. One quantity is said to *vary directly*, as a second, and *inversely*, as a third, when the first cannot be changed in any manner, but the second multiplied by the reciprocal of the third, is changed in the same proportion. For example, the base of a triangle varies as the area directly, and as the perpendicular altitude inversely; thus, if *A* denote the area, *B* the base, and *C* the altitude, then *A* varies as $B \times \frac{1}{C}$, or $A \propto \frac{B}{C}$. In general, if one quantity varies as another, it is equal to it multiplied by

some constant quantity. Thus, if A vary as B, and c be a constant quantity, then $A = cB$, or if A vary as $\frac{1}{B}$, then $A = \frac{c}{B}$. In *mech.*, a *variable motion* is that which is produced by the action of a force which varies in intensity.

VARIABLE, *n.* In *math.*, a quantity which is in a state of continual increase or decrease. The indefinitely small quantity by which a variable is continually increased or diminished, is called its *differential*, and the method of finding these quantities, the *differential calculus*.

VARIANCE, *n.* [See **VARY**.] In *law*, an alteration of something formerly laid in a writ; or a difference between a declaration and a writ, or the deed on which it is grounded. In ordinary language, a departure in the oral evidence from the statement in the pleadings, is termed a *variance*.—2. Any alteration or change of condition.—3. Difference that produces dispute or controversy; disagreement; dissension; discord. A mere *variance* may become a war. Without a spirit of concension, there will be an everlasting *variance*.—*At variance*, in disagreement; in a state of difference or want of agreement.—2. In a state of dissension or controversy; in a state of enmity.

VARIANT, *a.* Different; diverse.

VARIATION, *n.* [Fr. from *L. variatio*. See **VARY**.] 1. Our opinions are subject to continual *variations*.

3. In *gram.*, change of termination of nouns and adjectives, constituting what is called case, number, and gender; as, the *variation* of words.—4. Deviation; as, a *variation* of a transcript from the original.—5. In *astron.*, the variation of the moon is the third inequality in her motion; by which, when out of the quadratures, her true place differs from her place twice equated. It depends on the angular distance of the moon from the sun.—6. In *geography* and *navigation*, the deviation of the magnetic needle from the true north point, or the angle which the magnetic needle makes with the plane of the geographical meridian of a ship or station; called also *declination*. In *navigation*, the variation

of the compass is properly the angle between the magnetic axis of the needle and a meridian line passing parallel to the horizon through the centre of the compass. The variation of the compass does not remain constantly the same in the same place, but undergoes a slow and progressive change. The needle is observed to move gradually towards the west of the true meridian until it arrives at its maximum on that side; it then returns, passes over the true meridian, and moves easterly, until it arrives at its maximum towards the east, when it returns as before. In the year 1590, in London, the variation was $11^{\circ} 15'$ East; in 1660, the needle pointed due north, since which time it has travelled about $24\frac{1}{2}^{\circ}$ to the westward, and now it has begun to return. The variation however is very different in different parts of the globe, and it is also subject to diurnal changes in the same place.—7. In *music*, the different manner of singing or playing the same air or tune, by subdividing the notes into several others of less value, or by adding graces, yet so that the tune itself may be discovered through all its embellishments.—*Variation of curvature*, in *analytical geometry*, is that inequality or change which takes place in the curvature, in passing from one point of a curve to another. All curves are liable to this variation, with the exception of the circle in which the curvature is uniform at every point.—*Calculus of variations*, a branch of analysis, the chief object of which is to find what function of a variable will be a maximum or minimum on certain prescribed conditions. This calculus offers the only general, and frequently the only possible, means of solving those problems generally termed isoperimetrical.

6. In *nat. hist.*, a subdivision of a species; any individual plant or animal which differs from the rest of the species to which it belongs, in some accidental circumstances, which are not permanent, nor invariable, nor essential to the species. In *bot.*, the character of the species is found in its capability of reproducing by seed a plant which is more like itself than it is like any thing else; and this under all circumstances in which the offspring is capable of being produced. The variety differs from the species in points of structure, which are developed only under certain circumstances, arising from climate, cultivation, and other influences, and which are not essential to the species. While species having the normal form and colours, are perpetuated by seed, varieties, although often also propagated in the same manner, are liable to return to the original form, or to deviate into others, so that a variety cannot be preserved without much care. All species have a tendency to form varieties, but all the natural varieties of plants are nothing like so numerous, as those which arise from cultivation. In *zool.*, varieties, are individuals of the same species, which differ from the specific type, in size, colour, form, and relative proportion of the parts of the body, owing to the operation of different causes; as, age, climate, food, locality, domestication, &c.; but which like the varieties of plants, are liable to revert to the original typical form, in successive generations.—7. The resinous substances most commonly employed for varnishes are mastic, sandarac, lac, benzoin, copal, amber, and asphaltum; and the solvents employed are alcohol, volatile oil, or fixed oil. Hence, varnishes may be divided into three classes, alcoholic or spirit varnishes, volatile-oil varnishes, and fixed-oil varnishes. But as the materials to which varnishes are applied, and the purposes they are designed to answer, differ very widely, varnishes of course vary in a similar degree, and receive different names accordingly. Amber varnish is made of amber, linseed oil, litharge, and turpentine. Black varnish, for Japanese wood and leather, is made by mixing lampblack with a proper quantity of a strong solution of lac in spirit of wine.—2. ment through pores on its outer sur-

entirely decomposed. [See **PLANT**.]—
2. In a more limited sense, vegetables
are such plants as are used for culinary
purposes and cultivated in gardens,
or are destined for feeding cattle and

produce new individuals, and perform
various other functions, analogous to
those of animals, and which are essen-
tially characteristic of life.—*Vegetable*

matter is in much larger proportion
than the primitive earths.—*Vegetable*
kingdom, that division of natural history

ently give the names of *vegetables* and
plants. The science which treats of
these is termed *Botany*,—*which see*.—

very hard vegetable substance, resem-
bling the finest ivory in texture and

mental work. It is the produce of a
species of palm, *Phytelephas macrocar-
pas*, in the form of a nut, often as large
as a hen's egg.—*Vegetable physiology*,
that branch of botany which treats of
the vital actions of plants, or of the
offices which their various organs per-
form.—*Vegetable morphology*. [See
MORPHOLOGY.]—*Vegetable tissues*.
[See **TISSUE**.]—*Vegetable acids*, acids
obtained from plants, as vinegar, malic,
citric, gallic, &c., acids.—*Vegetable*
alkalies, such as are obtained from
vegetables; as, morphia, cinchona,
strychnia, &c.—*Vegetable butters*, the
concrete oil of certain vegetables, so
named from its resemblance to the

that vegetation depends on heat and
on certain substances which constitute
the nutriment of plants. Rapid *vegeta-
tion* is caused by increased heat and
a rich soil.—2. Vegetables or plants
in general. In June, *vegetation* in our
climate wears a beautiful aspect.—
Vegetation of salts, so called, consists in
certain crystalline concretions formed

VEIN, *n.* [Fr. *veine*; *L. vena*, from the
root of *venio*, to come, to pass. The
sense is a passage, a conduit.] 1. In
anat., a long membranous canal which
continually becomes wider, does not
pulsate, and returns the blood from
the arteries to the heart. The veins
may be arranged in three divisions:
1. Those that commence from the
capillaries all over the body, and re-
turn the blood to the heart; 2. The
pulmonary veins; 3. The veins of the
vena portæ, in which the blood that
has circulated through the organs of
digestion is conveyed to the liver.
The veins are composed, like arteries,

of three tunics or coats, which are much more slender than in the arteries, and are supplied internally with semilunar membranes or folds, called valves. All veins originate from the extremities of arteries, or, more properly speaking, from the capillary vessels which connect the veins and arteries, and terminate in the auricles of the heart. Their use is to return the blood from the arteries back to the heart.—2. In *plants*, a tube or an assemblage of tubes, through which the sap is transmitted along the leaves. The term is more properly applied to the finer and more complex ramifications, which interbranch with each other like net-work; the larger and more direct assemblages of vessels being called *ribs* and *nerves*. Veins are also found in the calyx and corol of flowers. The vessels which branch or variously divide over the surface of leaves are called *veins*.—3. In *geol.* and *mineral.*, cracks or fissures in rocks, filled up by substances different from the rock, and which may either be earthy or metallic. Veins are sometimes many yards wide, having an extent of many miles, and they ramify or branch out into innumerable smaller parts, often as slender as threads, like the veins of an animal; hence their name. Metallic veins are chiefly found in the primary, and lower, and middle secondary rocks. Many species of stones, as granite, porphyry, &c., are often found in *veins*.—4. against the earth. The front wheel may be turned at pleasure, so that the rider may give any direction to the machine. This species of vehicle was invented by M. Drais at Mannheim, in 1817. It was improved by Knight in England, who received a patent for it,

but it never came into general use.—2. A name given to a boat, car, or other vehicle, which moves with rapidity.—3. Any thing which moves with velocity.

VELOCITY, *n.* [Fr. *velocité*; L. *velocitas*, from *velox*, swift, allied to *volo*, to fly.] 1. Swiftmess; celerity; rapidity; as, the *velocity* of wind; the *velocity* of a planet or comet in its orbit or course; the *velocity* of a cannon ball; the *velocity* of light. In these phrases, *velocity* is more generally used than *celerity*. We apply *celerity* to animals; as, a horse or an ostrich runs with *celerity*, and a stream runs with *rapidity* or *velocity*; but bodies moving in the air or in ethereal space, move with greater or less *velocity*, not *celerity*. This usage is arbitrary, and perhaps not universal.—2. In *physics*, *velocity* is that affection of motion by which a body moves over a certain space in a certain time; or, it is the measure of the degree in which a body moves quickly or slowly; that is, one body is said to have a greater *velocity* than another, when it moves over a greater space in the same time, or an equal space in a less time. The *velocity* of a body is *uniform* when it passes through equal spaces in equal times, and it is *variable* when the spaces passed through in equal times are unequal. The *velocity* of a body is *accelerated* when it passes through a greater space in equal successive portions of time; and it is *retarded*, when a less space is passed through in each successive portion of time.—*Absolute velocity* is that in which the *velocity* of a body is considered simply in itself or as passing over a certain space in a certain time.—*Relative velocity* is that which has respect to the *velocity* of another moving body.—*Angular velocity*, the *velocity* of a body revolving about a fixed point or axis, or oscillating about a fixed point. The angular *velocity* of a planet is estimated by the angle described at the centre of the sun, by a straight line drawn from that point to the planet, called the *radius rector*.—*Initial velocity*, the *velocity* with which a body begins to move. When the motion of a body is uniform, its *velocity* is measured by the space described by it in a unit of time, as one second. If the motion of the body is not uniform, its *velocity* is measured by the space which it would describe uniformly in a given time, if the motion became and continued uniform from that instant of time. The unit of space and time taken in order to measure *velocity*, may be assumed of any magnitude, but in theoretical mechanics, one second is usually taken as the unit of time, and one foot as the unit of space; so that if a body is said to have a *velocity* of 25, it is implied that the body is moving at such a rate as would cause it to describe uniformly 25 feet in one second.—*Virtual velocities*.—[See under VIRTUAL.]

other parts, and transmits it to the
heart. It is distinguished into the
superior and *inferior*. *Vena porta*, the

In this case, vengeance is a just retribution, recompense, or punishment. In this latter sense the word is used in Scripture, and frequently applied to the punishments inflicted by God on sinners.

VENTRIL'QUISM, *n.* [L. *venter*, belly and *loquor*, to speak.] The act, art, or practice of speaking or uttering sounds in such a manner that the voice appears to come, not from the person, but from some distant place, as from the opposite side of the room, from the cellar, &c.

This was formerly supposed to be done by forming the articulations in the cavity of the chest or of the belly; hence the name. Ventriloquism may be regarded as a species of vocal mimicry of sounds, by which an illusion is produced on the hearer, who imagines that the sound comes, not from the mimic, but from some other appropriate source, at a given or varying distance, and in any or even several directions successively. To make the illusion perfect, the imitations require to be made without moving the lips, features, or body. The art of the ventriloquist is said to consist merely in this: after drawing a long breath so as to fill the lungs with air, he employs, during expiration, such organs of voice as can be used with as little movement of the lips, mouth, or cheeks as is compatible with the pronunciation of certain words or sounds. By a dexterous management of the tones of his voice in uttering such words or sounds in the way described, he easily leads his hearers to imagine that the sounds come from a person in a box, or up the chimney, or from inanimate objects, and, to aid the deception, he endeavours by various contrivances to divert the attention of his auditors. The word *Ventriloquy* is little used.

VENTUE, *n.* [L. *vicinia*; Norm. *visne*.] In *law*, a neighbourhood or near place; the place where an action is laid. The county in which the trial of a particular cause takes place, is said to be the *venue* of that cause. Originally jurors were summoned from the immediate neighbourhood where a fact happened, to try it by their own knowledge, but they are now summonable from the body of the county. In what are termed *local actions*, the actual place in which the subject matter is situated must be laid as the *venue* in the action; but in those actions termed *transitory*, that is, actions of debt, contract, for personal injuries, &c., any county may be laid as the *venue* in the action. In *criminal trials*, the *venue* is the county in which the offence charged was actually committed. The courts, however, have a discretionary power of changing the *venue*, both in civil and criminal cases.

VENUS, *n.* [L.; W. *Gwener*, from *gwen*, white, fair, the feminine of *gwyn*, white, fair, that affords happiness; also *gwynn*, rage, violent impulse of the mind, lust, smart; *gwynnu*, to whiten; *gwynnt*, wind, L. *ventus*; *gwynnawg*, full of rage; *gwent*, an open country; *gwenau*, to smile; *gwenwynn*, poison, L. *venenum*, Eng. *venom*; *gwenwynnau*, to poison, to fret,

or irritate. These affinities lead to the true origin of these words. The primary sense of the root is to shoot or rush, as light or wind. From light is derived the sense of white, fair, Venus, or it is from opening, parting; and from rushing, moving, comes *wind*, and the sense of raging, fury, whence *L. venenum*, poison, that which frets or causes to rage. These words all coincide with *L. venio*, which signifies to rush, to fall, to happen; *venor*, to hunt, &c. The Greeks had the same idea of the goddess of love, viz., that her name signified fairness, whiteness, and hence the fable that she sprung from froth, whence her Greek name *Αφροδιτη*, from *αφρος*, froth. But Venus may be from lust or raging.] 1. In *myth.*, the goddess of beauty and love; that is, beauty or love deified; just as the Gaelic and Irish *diana*, swiftness, impetuosity, is denominated the goddess of hunting. The poets mention two of the name Venus, the elder daughter of Uranus and the younger daughter of Jupiter and Dione, but the events in the history of the two are often confounded. She is represented by the Greeks as the highest ideal of female beauty and love, sometimes entirely naked and sometimes but slightly covered. The most famous antique statue of Venus

Venus of Canova.

is the dé Medici found in the Villa Hadriana at Tivoli, and one of the most famous modern statues of this goddess is the Venus of Canova, where she is represented as rising from the bath.—2. In *astron.*, one of the inferior planets, the second in order of distance from the sun, and the most brilliant of all the planetary bodies. From her alternate appearance in the morning and evening, she was called by the ancients *Lucifer* and *Hesperus*, the morning and evening star. The distance of Venus from the sun is about 68 millions of miles; her diameter 7700 miles; and her period of revolution round the sun about 224 mean solar days. She revolves about an axis, and the time of rotation is about 23^h. 21^m., the axis of rotation being inclined to the ecliptic at an angle of about 75°. Her greatest angular distance from the sun is from 45° to 47° 12'. According to her various positions relatively to the sun and earth, she changes her phases like the moon, appearing *full* at the superior conjunction, *gibbous* between that point and the points of her greatest elonga-

tion, *half-mooned* at these points, and *crescent-shaped* or horned between these and the inferior conjunction. Venus is sometimes seen to pass over the disc of the sun, and this passage is called a *transit of Venus*. [See *TRANSIT*.]—3. In the *old chemistry*, a name given to copper.—4. In *conchology*, a Linnæan genus of marine bivalve molluscs, including the common clam. The species are found buried in the sand, near the shore, particularly in hot climates. American Indians, formed into various ornaments.

The question of the court is, whether you know the witness to be a man of *veracity*. We rely on history, when we have confidence in the *veracity* and industry of the historian. "The *veracity* of facts," is not correct language. *Truth* is applicable to men and to facts; *veracity* to men only, or to sentient beings.—2. Invariable expression of truth; as, the *veracity* of our senses.

VERANDA, } *n.* An Oriental word **VERAN'DAH**, } denoting a kind of open portico, or a sort of light external gallery in front of a building with a sloping roof, supported on slender pillars, and frequently partly enclosed in front with lattice-work. The *V. viride* of North America is an acrid emetic and powerful stimulant, followed by sedative effects.

The verb affirms, declares, asks, or commands; as, *I write*; he *runs*; the river *flows*; they *sleep*; we *see*; they *are deceived*; *depart*; *go*; *come*; *write*; *does he improve*? When the action expressed by a verb is exerted on an object, or terminates upon it, the act is considered as passing to that object, and the verb is called *transitive*; as, *I read Livy*. When the act expressed by the verb, terminates in the agent or subject, the verb is called *intransitive*; as, *I run*; *I walk*; *I sleep*. They are not of much importance in a medicinal or economical point of view, with the exception of the teak-tree, and the *Lantana pseudothea*, used in infusion as tea in Brazil. VER'DEGRIS, } green-gray.] Diacetate of copper. It was formerly prepared almost exclusively in France, by causing the husks and stalks of the grape, after wine-making, to ferment in contact with copper plates, by which means a coat of verdigris was formed on the surface of the copper. It is now prepared in England by more direct processes, principally by alternating copper plates and pieces of coarse woollen cloth previously soaked in crude pyroligneous acid. Verdigris, when pure, is in the form of light blue acicular crystals of a silky lustre. It is decomposed by the stronger acids, by the alkalies, and by heat. It is much employed as a pigment in hat-making, dyeing black, in several processes in the chemical arts, and in medicine. Verdigris, like all the compounds into which copper enters, is poisonous. This salt is very apt to form on the surface of copper utensils by the action of vegetables. *Distilled verdigris*, a binacetate or superacetate of copper.

VERNIER, *n.* [From the inventor, Peter Vernier.] A small movable scale, running parallel with the fixed scale of a quadrant, barometer, or other graduated instrument, and having the effect of subdividing the divisions of that instrument into more minute parts. The diagram represents the vernier of the common barometer for measuring to the hundredth of an inch. The scale A B is divided into inches, and tenths of inches; the small movable scale C D is the vernier, and consists of a length of eleven parts of A B, divided into ten parts, each part being therefore equal to one and one-tenth of the divisions upon A B, and the difference between any division on the scale and vernier will be one-hundredth of an inch. In the figure, the zero of the vernier is set to the division 30 inches, the division 10 upon the vernier corresponding with that of 28 inches 9-10ths on the scale. Hence, the vernier division 1 is one-hundredth of an inch below the scale division 29 inches 9-10ths; division 2 on the vernier is two-hundredths below 29 inches 8-10ths, and so on. Supposing the vernier were raised any number of hundredths, as two-hundredths of an inch, the division 2 would coincide with 29 inches 8-10ths. To read off the hundredths of an inch the vernier zero advances beyond any tenth on the scale; the division that coincides nearest with any on the scale, must be taken for the hundredth required.—*Chromatic vernier*, an instrument invented by Sir David Brewster, for the purpose of measuring by comparison the very minute variations of tints.

VERT'EBRE, } *Vert'ebres.* [L. *vertebra*, from *verto*, to turn, Fr. *vertebre.*]

A bone of the spine, or back bone of an animal. The different vertebrae which compose the spine, are divided into *true* and *false*, the former constituting the upper and longest portion, and the latter the lower portion of the spinal column, consisting of the *os sacrum* and *coccyx*.

The true vertebrae are further divided into *cervical*, *dorsal*, and *lumbar*; or those of the neck, back, and loins. In man there are seven cervical vertebrae, twelve dorsal, and five lumbar. There is in every vertebra, between its body and apophyses, a foramen or hole, large enough to admit a finger. These foramina correspond with each other through all the vertebrae, and form a long bony conduit for the lodgment of the spinal marrow. The vertebrae are united together by means of a substance compressible like cork, which forms a kind of partition between them, and admits of a certain degree of motion, small between individual bones, but considerable as respects the whole spinal column. The vertebrae and their pro-

jections or processes, also afford attachments for a number of muscles and ligaments, and also passages for blood vessels, and for the nerves that pass out of the spine. In different animals the number of vertebrae varies exceedingly.

By this act it was decreed that no one should be admitted a minister of any vacant church, if a majority of the male heads of families, in full communion with the church, should dissent from his call. VIBRATING, *ppr.* Brandishing; moving to and fro, as a pendulum or musical chord.

VIBRA'TION, *n.* [Fr. from *L. vibro*.] 1. The act of brandishing; the act of moving or state of being moved one way and the other in quick succession. —2 In *mech.*, a regular reciprocal motion of a body suspended; a motion consisting of continual reciprocations or returns; as, of the pendulum of a time-keeper. This is more frequently called *oscillation*. The number of *vibrations* in a given time depends on the length of the vibrating body. The number of *vibrations* performed by two pendulums of different lengths in a given time is inversely as the square roots of their lengths, and the times of their *vibrations* are directly as the square roots of their lengths. The *vibrations* of a pendulum are somewhat slower at or near the equator, than in remote latitudes, in consequence of the diminution of the force of gravity at or near the equator. The *vibrations* of the same pendulum, or of different pendulums of the same length, in the same place, in very small arcs of circles, are always performed in the same time. [See *OSCILLATION*, *PENDULUM*.] —3. In *physics*, the tremulous motion produced in a body when struck, or when its particles are disturbed by any action or impulse; sound is produced by exciting *vibrations* in the bodies emitting it. The term *vibration* is also applied to the alternate or reciprocating motion which is produced among the particles of a fluid or ethereal medium when their equilibrium is disturbed by any impulse; by which means waves or undulations are caused; as, the *vibrations* produced in water when agitated; the *vibrations* produced in the air by sounding bodies; the *vibrations* produced in a supposed ethereal medium by luminous bodies or by heat; the *vibrations* of the nervous fluid, by which sensation has been supposed to be produced, by impressions of external objects propagated thus to the brain. —4. In *music*, the regular reciprocating motion of a chord or of a body, which, when suspended, or stretched between two fixed points, swings or shakes to and fro, and thus produces musical sounds, or tones. The number of *vibrations* performed by a musical string, in a given time, is directly as the length of the string; the number of *vibrations* are also proportional to the square roots of the forces by which the strings are stretched. The times of *vibrations* of different strings are as their lengths directly, and the square roots of the tending forces inversely. The number of *vibrations* will also depend on the thickness and density of the strings, being much less in thick and heavy strings, than in small and light ones. In wind instruments, the sounds are produced by the *vibrations* of a column of air, contained in a straight or crooked tube. [See *SOUND*, *TOPE*.]

There are several varieties, all hardy evergreen shrubs, and general favourites. *V. lantana*, the wayfaring tree, is a native of Europe and the west of Asia. The young shoots are used in Germany for basket-making; the wood is sometimes employed in turning and cabinet-making; the berries are used for making ink, and the bark of the root for making birdlime. *V. opulus*, the guelder rose, is native throughout Europe, and is especially frequent in Britain and Sweden. The primary sense is to urge, drive, or strive; hence to subdue.] 1. One who conquers in war; a vanquisher; one who defeats an enemy in battle. *Victor* differs from *conqueror*. We apply *conqueror* to one who subdues countries, kingdoms, or nations; as, Alexander was the *conqueror* of Asia or India, or of many nations, or of the world. In such phrases, we cannot substitute *victor*. But we use *victor*, when we speak of one who overcomes a particular enemy, or in a particular battle; as, Cæsar was *victor* at Pharsalia. The duke of Wellington was *victor* at Waterloo. *Victor* then is not followed by the possessive case; for we do not say, Alexander was the *victor* of Darinus, though we say, he was *victor* at Arbela.—2. This word is now never used in the singular.] Food for human beings, prepared for eating; that which supports human life; provisions; meat; sustenance. We never apply this word to that on which beasts or birds feed, and we apply it chiefly to food for men when cooked or prepared for the table. We do not now give this name to flesh, corn, or flour, in a crude state; but we say, the *victuals* are well cooked or dressed, and in great abundance. breast and lower parts white. It is a native of South America, and frequents lofty slopes in the Andes of Chili, &c., where some scanty vegetation is to be found, but never ventures up to the naked rocky summits, for its soft tender feet are only suited for turfy ground. It lives in herds of 6 to 15 females, and one male, the leader and protector of the herd, who, standing at a short distance, while the females are feeding, gives timely warning of danger, by a sort of whistling sound and a quick movement of the foot.

The party wishing for the view applies to the court for a view, and where it is granted, six jurors are selected for the purpose, called *viewers*, who must be summoned by the sheriff to attend at the place in question, where the premises are pointed out to them by two persons named by the court, and technically called *shevers*. The object of the view is to render the ground of dispute more intelligible to the jury, but it is only granted where the necessity for it is made very apparent. According to the French orthography, this word is formed from *vile*; but the orthography in other languages connects this word with *vill*, *village*, and this is probably the true origin.] 1. In *feudal law*, a villain or villein is one who holds lands by a base or servile tenure, or in *villanage*. Villains, who belonged principally to lords of manors, were of two sorts; *villains regardant*, that is, annexed to the manor or land, *adscriptitii glebæ*; or *villains in gross*, or at large, that is, annexed to the person of their lord, and transferable by deed from one owner to another. They could not leave their lord without his permission; but if they ran away, or were purloined from him, they might be claimed and recovered by action like beasts, or other chattels. They held indeed small portions of land to sustain themselves and families, but it was at the mere will of the lord, who might dispossess them whenever he pleased, and their tenure bound them to what were termed *villein* or ignoble services. A villain could acquire no property either in land or goods; if he purchased either the lord might seize them to his own use.—2. A vile wicked person; a man extremely depraved, and capable or guilty of great crimes. We call by the name of *villain*, the thief, the robber, the burglarian, the murderer, the incendiary, the ravisher, the seducer, the cheat, the swindler, &c.

VIL/LENAGE, *n.* [from *villain*.] A tenure of lands and tenements by base services. This tenure was neither strictly feudal, Norman, or Saxon, but mixed and compounded of them all. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base and menial services. Where the service was base in its nature, and undefined as to time and amount, the tenure received the name of *pure villenage*, but where the service, although of a base nature, was certain and defined, it was called *privileged villenage*, and sometimes *villein socage*. It frequently happened that lands held in villenage descended in uninterrupted succession from father to son, until at length the occupiers or villeins became entitled, by prescription or custom, to hold their lands against the lord, so long as they performed the required services. And although the villeins themselves acquired freedom, or their land came into the possession of freemen, the villein services were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts—baron, in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay. And as such tenants had nothing to shew for their estates but the entries into those rolls, or copies of them authenticated by the steward, they at last came to be called *tenants by copy of court-roll*, and their tenure a *copy-hold*.

It is now more usual, however, to enclose quantities that are to be connected together, within parentheses or brackets: thus, $(a + b + c) \times x$ or $\{a + b + c\} \times x$; $(x^2 - y^2) \div (x + y)$, or $\{x^2 - y^2\} \div \{x + y\}$.—3. In wine countries it is obtained from the acetous fermentation of inferior wines, but in this country it is usually procured from an infusion of malt which has previously undergone the vinous fermentation. Vinegar may also be obtained from strong beer,

by the fermentation of various fruits, or of a solution of sugar mixed with yeast; in short, all liquids which are capable of the vinous fermentation may be made to produce vinegar. 120 parts of water, 12 of brandy, 3 of brown sugar, 1 of tartar, and $\frac{1}{2}$ of sour dough, if left for some weeks in a warm place, yield a strong and pleasant vinegar. All the above vinegars yield by distillation a purer and somewhat weaker acetic acid, called *distilled vinegar*.—*Radical vinegar*, hydrated acetic acid, obtained by distilling 3 parts of dry powdered acetate of soda, with 9·7 of oil of vitriol, as pure and concentrated as possible. This vinegar, holding camphor and essential oils in solution, constitutes the *aromatic vinegar* of the shops.—*Wood vinegar*, pyroigneous acid,—*which see*. Common and distilled vinegars are used in pharmacy for preparing many remedies, and externally in medicine, in the form of lotions. The use of vinegar as a condiment is universal. It consists in the peculiar decomposition which the different species of sugar undergo in certain circumstances, and by which their elements combine to form new compounds, which, under similar conditions, are always the same. When a saccharine solution is placed in contact with substances in a state of decomposition or putrefaction, it is observed, after about 24 hours, if the temperature be kept between 40° and 85°, that the taste of the sugar has disappeared; pure carbonic acid is disengaged, and the liquid has acquired intoxicating qualities. It now contains alcohol, which may be separated by distillation. [See FERMENTATION.]

The viol was a stringed instrument with frets, and played on by a bow. There were three sorts, treble, tenor, and base, each having six strings. The *treble viol* was somewhat larger than our violin, and the music for it was written in the treble clef. The *tenor viol* was about the same length and breadth as the modern tenor violin, but thicker in the body, and the music for it was in the soprano, or C clef. The dimensions of the *base viol* were much the same as those of the violoncello, and the music for it was written in the base clef.—*Viol di gamba*, or *leg-viol*, an old musical instrument with six strings, so called because it was held between the legs. 2. Being in essence or effect, not in fact; as, the *virtual* presence of a man in his agent or substitute.—*Virtual focus*, in *optics*, the point from which rays, which have been rendered divergent by reflection or refraction, appear to issue. [*See FOCUS*.]—*Virtual velocity*, in *mech.*, the velocity which a body in equilibrium would actually acquire, during the first instant of its motion, in case of the equilibrium being disturbed. The principle of *virtual velocities* may be thus enunciated: "If any system of bodies or material points, urged each by any forces whatever, be in equilibrium, and there be given to the system any small motion, by virtue of which, each point describes an infinitely small space, which space will represent the *virtual* velocity of the point; then the sum of the forces, multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing, regarding as positive the small spaces described in the direction of the forces, and as negative those described in the opposite direction." This great principle may be considered as the golden rule of mechanics. It is easily verified by experiment with respect to the six mechanical powers, but it applies immediately and most evidently to all

questions respecting equilibrium or statical problems, and it furnishes a very easy method of ascertaining the power of any machine, or the proportion between two forces which would balance one another. For according to this principle, the power multiplied by the space through which it moves in the vertical direction, must always be equal to the weight multiplied by the space through which it moves in the vertical direction.

This term was employed by Newton to signify a power implanted in all matter, by which it resists any change endeavoured to be made in its state; that is, by which it becomes difficult to alter its state either of rest or motion. A distinction is made between *vis inertia* and *inertia*, the former implying the *resistance* itself which is given by a body to any force endeavouring to make it change its state; and the latter merely the *property* by which the resistance is given.—*Vis motrix*, moving force.—*Vis mortua* and *vis viva*, terms used by Leibnitz and his followers; the former signifying the power of pressure in a body at rest; and the latter, the force or power of a body in motion, estimated by the distance to which the body goes.—2. It is also termed *vis conservatrix*.—*Vis mortua*, that property by which a muscle, after the death of the animal, or immediately after having been cut out of the living body, contracts.—*Vis nervosa*, the power of the muscles, by which they act, when excited by the nerves, as opposed to the *vis insita*.—*Vis plastica*, the formative power or energy which spontaneously operates in animals.—*Vis vite*, the vital power or energy; the natural power of the animal machine in preserving life.—3. VITACEÆ, *n.* A nat. order of plants, of which the genus *Vitis* is the type. The species are, for the most part, inhabitants of the warmer parts of the temperate zone, and are found in both the old and new worlds, especially in Asia. They are composed of sarmentose and climbing shrubs; the lower leaves are opposite, and the upper ones alternate, stalked, simple, lobed, or compound, with stipules at the base. The peduncles are racemose,

thyrsoid, corymbose, cymose, or umbellate, opposite the leaves, and are sometimes changed into tendrils. The most characteristic property of this order is acidity, which is most fully developed in the grape-vine. The acid of the grape is chiefly the tartaric; malic acid is, however, found in them. The dried fruit and wine are the really important products of the grape, and are yielded by no other of the order, if we except the Fox-grapes of North America. All the species are climbing plants, and some of them are supplied with hooked tendrils, by which they lay hold of the branches of trees, and thus elevate themselves above their summits.

VITIS, *n.* The vine. A genus of plants, the type of the nat. order *Vitaceæ*. The species, which are found chiefly in Asia and America, are climbing shrubs, with simple lobed, cut, or toothed, rarely compound leaves, and thyrsoid racemes of small greenish yellow flowers. The best known, and by far the most important species, is

Vine (*Vitis vinifera*).

the *V. vinifera*, the common vine, or grape-vine, of which there is a multi-

tude of varieties. The cultivation of the vine extends from near 55° north latitude to the equator, but in south latitudes it only extends to about 40°. It is rarely grown at a greater altitude than 3000 feet. In favourable seasons the vine ripens in the open air in England, and in the 11th and 12th centuries, considerable quantities of inferior wine were made from native grapes. Vineyards are now, however, unknown in this country; but the grapes raised in hot houses are excellent. The vine grows in every sort of soil; but that which is light and gravelly seems best suited for the production of fine wines. It succeeds extremely well in volcanic countries. The vine is a long-lived plant; indeed, in warm climates, the period of its existence is not known. It is propagated from seeds, layers, cuttings, grafting, and by inoculation. Several species of vine are indigenous in North America, as the *Vitis labrusca*, the wild-vine or fox-grape; *V. cordifolia*, heart-leaved vine or chicken grape; *V. riparia*, river-side or sweet-scented vine. [See WINE.]

Resembling glass; as, the *vitreous* humour of the eye, so called from its resembling melted glass. This humour occupies more than three-fourths of the interior of the eye, and is seated behind the crystalline lens. The rays of light which enter the eye undergo two refractions in passing through the aqueous humour and crystalline lens. On entering the vitreous humour they undergo a third refraction, thus acquiring their final degree of convergence, so that they form an image at a focus on the retina or very near it. *Vitreous electricity*, that produced by rubbing glass. [See ELECTRICITY.]

VITRIFIED, *pp.* Converted into glass.—*Vitri-fied forts*, a name given to certain remarkable enclosures of stone existing in various parts of Scotland, especially in Inverness-shire. They are constructed of stones piled rudely upon one another, and firmly cemented together by some material which has been vitrified by fire, the stones themselves being also partially vitrified. They generally surround the top of some steep conical hill, and are supposed to have been intended for defensive military posts. Various hypotheses have been framed to account for the vitrified appearance of these structures, but it seems most reasonable to suppose that the material of which they are built was selected with a view to its capability of being vitrified; for the stones that have been most commonly used are granite or moorstone, limestone, sandstone, and pudding-stone, all of which are more or less easily fusible by fire, and the process of vitrification may have been rendered easy by the quantities of wood which in early times covered the Highlands.

VITRIFORM, *a.* [L. *vitrum*, glass, and *form*.] Having the form or resemblance of glass.

VOICE, *n.* [*Fr. voix; L. vox; It. voce; Sp. voz; Gaelic, bagh, a word; baigh-am, to speak to; Ir. focal, a word; Sans. vach, to speak, L. voco.* The sense of the verb is to throw, to drive out sound; and *voice* is that which is driven out.] 1. An audible sound or noise produced in the throat and mouth of an animal by peculiar organs. Voices are either *articulate* or *inarticulate*. Articulate voices are those of which several conspire together to form some assemblage or little system of sounds; such are the voices expressing the letters of an alphabet, numbers of which joined together form words. Inarticulate voices are such as are not organized or assembled into words; as, the barking of dogs, the braying of asses, the hissing of serpents, the singing of birds, &c. We say, the *voice* of a man is loud or clear; the *voice* of a woman is soft or musical; the *voice* of a dog is loud or harsh; the *voice* of a bird is sweet or melodious. The *voice* of human beings is articulate; that of beasts, inarticulate. The *voices* of men are different, and when uttered together, are often dissonant. Mammals, birds, and reptiles are the only animals which possess a voice. In mammals, the air driven by the muscles of expiration from the lungs through the trachea, strikes against the two vibratile vocal chords, which bound the idea of the glottis, and thus a voice is produced varying in different animals according to the structure of the organs, and the power which the animal possesses over them. In man, the superior organization and mobility of the tongue and lips, enable him to modify his vocal sounds so as to render them articulate, and adapted to express his ideas. The infinite varieties of sounds heard in the human voice, are all embraced under the general terms, *pitch, loudness, quality, and duration*. A good musical voice depends chiefly upon the soundness and power of the organs of utterance and of hearing, and the musical disposition, and is distinguished by clearness of intonation, ease, strength, duration, equality, harmoniousness and fullness of the sounds.—2. Any sound made by the breath; as, the trumpet's *voice*.—3. A vote; suffrage; opinion or choice expressed. Thus substances which affect the smell with pungent or fragrant odours, as musk, hartshorn, and essential oils, are called *volatile* substances, because they waste away on exposure to the atmosphere. Alcohol and ether are called *volatile* liquids for a similar reason, and because they easily pass into the state of vapour on the application of heat. On the contrary, gold is a *fixed* substance, because it does not suffer waste, even when exposed to the heat of a furnace; and oils are called *fixed*, when they do not evaporate on simple exposure to the atmosphere. [See OIL.]—4. Lively; gay; full of spirit; airy; hence, fickle; apt to change; as, a *volatile* temper.

VOLCAN'IC, *a.* [from *volcano*.] Pertaining to volcanoes; as, *volcanic* heat.—2. Produced by a volcano; as, *volcanic* tufa.—*Volcanic products* are numerous and diversified, but lava, scoria, enamel, and glass, comprise by far the most important and interesting of them. The substances thrown out during volcanic eruptions, whether stony, liquid, or gaseous, disclose more or less completely the nature and condition of the interior masses of the globe. In the lava, or melted rock, the most important ingredients are felspar, augite, and oxide of iron, the mass being modified by various additional minerals and me-

talic substances. The same substances compose the ashes of scoria. The liquid products of volcanoes, besides abundance of water, contain sometimes sulphuric and muriatic acids. Sublimations of common salt, and muriate of ammonia, are also found among these products. Among the gaseous products, chlorine, azote, sulphuretted hydrogen, sulphurous acid, and carbonic acid are the most common.—*Volcanic rocks*, rocks which have been formed by volcanic agency, as *trachyte*, *pumice*, *obsidian*, *augitic*, or *felspathic rocks*, &c.—*Volcanic bombs*, the name given to detached masses of melted lava, sometimes thrown out by volcanoes, which masses, as they fall, assume rounded forms, like bomb-shells, and are often elongated into a pear shape.—*Volcanic foci*, the subterranean centres of action in volcanoes, where the heat is supposed to be in the highest degree of energy.—3. Changed or affected by the heat of a volcano.

VOL'CANO, *n.* [It. from *Vulcan*.] 1. In *geol.*, an opening in the surface of the earth or frequently in a mountain, from which smoke, flames, stones, lava, or other substances are ejected. Such are seen in Etna and Vesuvius in Sicily and Italy, and Hecla in Iceland. It is vulgarly called a *burning mountain*, a name quite inapplicable, as many volcanoes are not in mountains, and some are submarine, ejecting their contents from under the sea. The eruptions from volcanoes are in general only temporary, a cessation, sometimes extending to centuries, intervening between the explosions; although, in other cases, a slow action is constantly going on with periods of increased energy, at intervals of months or years.

Volcanoes are called *active*, when they continue to eject melted matter, mud, or vapours at intervals; and *extinct*, when they have ceased to emit such matters within the records of history. According to Jameson, about 193 active volcanoes have been observed; of which 13 belong to Europe and its islands, 66 to Asia and its islands, 8 to the islands of Africa, and 106 to America and its islands. Volcanoes usually form series of immense extent, frequently running in right lines although widely separated from each other. Volcanic eruptions are preceded by earthquakes, and earthquakes and volcanoes may be considered as different effects produced by the agency of internal heat, arising from chemical processes going on in the bowels of the earth.—2. The mountain that ejects fire, smoke, &c.

The agent itself is denominated *galvanism*, after its discoverer, Galvani, while the instruments used for exciting and accumulating it are called *voltaic*, in honour of Volta, who first contrived this kind of apparatus. [See GALVANIC, GALVANISM.]—*Voltaic pile*, a column formed by successive pairs of

plates of two dissimilar metals, as zinc and copper, alternating with moistened flannel or pasteboard, in regular order of succession. VOLTAISM, *n.* [from *Volta*, an Italian.] That branch of electrical science which has its source in the chemical action between metals and different liquids. It is so named from the Italian philosopher, Volta, whose experiments contributed greatly to the establishment of this branch of science. It is, however, more usually called *galvanism*, from Galvani, who first showed or brought into notice the remarkable influence produced on animals by this species of electricity.

VOLTA-METER, *n.* [*Volta*, and *Gr. μέτρον*, measure.] An instrument contrived by Faraday, for measuring the amount of voltaic electricity passing in a current through it, by means of the quantity of water decomposed in a given time. In principle, it consists of a graduated tube, *c*, closed at one end, and inserted through a wooden cap into a jar, *d*, through the bottom of which the platina electrodes, *f*, connected with the two poles of the battery, *a* and *b*, are introduced.

To determine the amount of any voltaic current passing through it, the tube, *c*, is taken out and filled with dilute sulphuric acid and water, then turned down into the solution in the jar, *d*, care being taken that in so doing no air is admitted into the top, and that the two platina electrodes are introduced under the mouth of the tube. The number of cubic inches of the mixed gases evolved by the current over a given time, may be read off on the scale by the depression of the fluid in the tube. This instrument is also frequently used to exhibit the analysis of water, the two gases, oxygen and hydrogen, being evolved, one at the positive and the other at the negative electrode. For this purpose the instrument is then furnished with two separate tubes, one over each electrode, to collect the respective gases. In the use of these instruments, all contact of the electrodes with each other must be carefully avoided.

Primarily, something rolled or convolved; a roll, as the ancients wrote on long strips of bark, parchment, or other material, which they formed into rolls or folds. Of such volumes, Ptolemy's library in Alexandria is said to have contained 700,000.—2. A roll or turn; as much as is included in a roll or coil; as, the *volume* of a serpent.—3. Dimensions; compass; space occupied; bulk, size, or solid content; as, the *volume* of an elephant's body; the *volume* of a sphere; the *volume* of a cylinder; a *volume* of gas. In *chem.*, the size or bulk of an atom of any gaseous body is termed its *atomic volume*. It is not meant, however, that we can ascertain the absolute volume of the atoms, but the relative or comparative volume of the atoms or particles of two or more gases. It is generally admitted that equal volumes or bulks of different elementary gases contain different numbers of atoms, and hence the atoms must be of different sizes: Thus, the atoms of oxygen gas are $\frac{1}{2}$ the size, and those of sulphur $\frac{1}{3}$ the size of the atoms of hydrogen, nitrogen, chlorine, &c. To obtain the relative atomic volume of any gas, the atomic weight is divided by the specific gravity. Thus, the atomic weight of oxygen = 8, divided by its specific gravity 16, (that of hydrogen being 1,) gives the quotient $\frac{1}{2}$ for the atomic volume of oxygen. When two gaseous bodies combine together, it is always in such proportions by volume, that one volume of the one gas combines with one, two, or more volumes of the other, and thus the composition of gaseous bodies may be expressed by volume as well as by

weight. The theory of volumes has recently been extended to solids and liquids.—4. A swelling or spherical body.

The undulating billows rolling their silver *volumes*. *Irving*.

5. A book; a collection of sheets of paper, usually printed or written paper, folded and bound, or covered. A book consisting of sheets once folded, is called a folio, or a folio *volume*; of sheets twice folded, a quarto; and thus, according to the number of leaves in a sheet, it is called an octavo, or a duodecimo. The Scriptures or sacred writings, bound in a single *volume*, are called the Bible.

Their shells are prized by collectors above most others for their beauty and rarity. A whirlpool; a whirling or circular motion of water, forming a kind of cavity in the centre of the circle, and in some instances, drawing in water or absorbing other things.—2. A whirling of the air; a whirlwind.—3. In the Cartesian system, the circular motion originally impressed on the particles of matter, carrying them around their own axes, and around a common centre. Descartes supposed that God created matter of an indefinite extension, and hence concluded that there is no vacuum, but that the universe is absolutely full. He further supposed that God, when he created matter, separated it into small square portions or masses full of angles; that he impressed two motions on this matter; the one by which each part revolved about its own centre or axis; and another, by which an assemblage or system of such parts, turned round a common centre. Hence arose as many different vortices, or eddies, as there were different masses of matter, thus moving about common centres. By means of these vortices, Descartes attempted to account for the formation of the universe, but his system has long since been exploded.

A *vow* is a promise of something to be given or done hereafter. A person is constituted a religious by taking three *vows*, of chastity, of poverty, and of obedience. Among the Israelites, the *vows* of children were not binding, unless ratified by the express or tacit consent of their father; Num. xxx. VULCANIST, *n.* One who supports the *Vulcanian* or *Plutonian* theory, which ascribes the changes on the earth's surface to the agency of fire, and maintains that all rocks are of igneous production. The *Vulcanists* maintain that the earth was at first in a state of igneous fusion, that it gradually cooled, and became covered only at a subsequent period. They maintain that the land was raised up by a subterranean force, their regularities which diversify its surface being the effects of volcanic eruptions; and that the transported soils have been formed by the disintegrations of the higher grounds. The *Vulcanists* were opposed to the *Neptun-*

ists, who maintained that all geological formations have been precipitated from water, or from a chaotic fluid. The *Vulcanian* theory has been expanded and illustrated by Lyell, and some other geologists of the present day.

VULCANIZA'TION, *n.* A new method of treating Indian rubber, by which its valuable properties are greatly increased, and some new ones bestowed upon it. It is as follows:—The Indian rubber is immersed in a bath of fused sulphur, heated to a proper temperature, until, by absorbing a portion of the sulphur, it assumes a carbonized appearance, and eventually acquires the consistence of horn. The same state can, however, be produced by either kneading the India rubber with sulphur, and then exposing it to a temperature of 190°, or by dissolving it in any of the common solvents, as turpentine, holding sulphur in solution or suspension. The compound thus formed is properly a sulphuret of caoutchouc, and possesses the following properties. It remains elastic at all temperatures; it cannot be dissolved by the ordinary solvents, neither is it affected by heat within a considerable range of temperature; finally, it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Vulcanized India rubber has been employed with great success as a substitute for the spiral steel springs used for the *buffers* of railway carriages, to moderate the effects of concussion. It is also used in railways, and is laid between the rail and the sleeper, and thus prevents the rails from indicating any traces of pressure. It forms in engines a most valuable material for washers, and it is formed into a tubing of great strength and flexibility, well adapted for fire-hose, and for any apparatus required in conveying steam, water, or gas. It also forms elastic bands, trouser-straps, surgical bandages, and a number of other articles.

VULCANIZED INDIAN RUBBER.

W.

W IS the twenty-third letter of the English Alphabet. It takes its written form and its name from the union of two Vs, this being the form of the Roman capital letter which we call U. The name, *double u*, being given to it from its form or composition, and not from its sound, ought not to be retained. Every letter should be

named from its sound, especially the vowels. W is properly a vowel, a simple sound, formed by opening the mouth with a close circular configuration of the lips. It is precisely the *ou* of the French, and the *u* of the Spaniards, Italians, and Germans. With the other vowels it forms diphthongs, which are of easy pronunciation; as in

well, want, will, dwell; pronounced *oell, ooant, oil, doell*. In English, it is always followed by another vowel, except when followed by *h*, as in *when*; but this case is an exception only in writing, and not in pronunciation, for *h* precedes *w* in utterance: *when* being pronounced *hoorn*. In Welsh, *w*, which is sounded as in English, is used with-

out another vowel, as in *fwl*, a fool; *dwn*, dun; *dob*, mortar; *gun*, a gun, and a gown. It is not improbable that the Romans pronounced *w* as we do *w*, for their *volvo* is our *wallow*; and *volo*, *velle*, is the English *will*, *G. wolen*. But this is uncertain. The German *v* has the sound of the English *f*, and *w* that of the English *v*. *W*, at the end of words, is often silent after *a* and *o*, as in *law*, *saw*, *low*, *sow*. In many words of this kind, *w* represents the Saxon *g*; in other cases it helps to form a diphthong, as in *now*, *vow*, *new*, *strew*. As an abbreviation, *W* stands for *west*; *W.N.W.*, for *west-north-west*; *W.S.W.*, for *west-south-west*, &c.

WAB'BLE, *v. i.* [*W. gwibiaw*, to wander, to move in a circular form.] To move from one side to the other; to vacillate; as a turning or whirling body. So it is said a top *wabbles*, when it is in motion, and deviates from a perpendicular direction; a spindle *wabbles*, when it moves one way and the other. A millstone in motion, if not well balanced, will *wabble*. [*This word is applied chiefly to bodies when turning with a circular motion, and its place cannot be supplied by any other word in the language. It is neither low nor barbarous.*]

It is found more abundantly in Germany than in any other country.

The lender or creditor is called the *wadsetter*, and the borrower the *reverser*. This was the earliest method of granting security on land in Scotland, and though still legal, it is now seldom, if ever, practised. *Wadsets* are divided into two sorts, *proper* and *improper*. When the *wadsetter* enters on possession, and takes, in place of interest, the yearly fruits, with the risk of the seasons, it is a proper *wadset*. When he agrees to accept of a fixed yearly sum as interest, and accounts to the *reverser* for the rents, the *wadset* is improper.

2. Subject on which bets are laid.—In *Eng. law*, wagers are valid, and may be made subjects of action, unless such as are rendered expressly void by law, or have an illegal or immoral tendency. In *Scots law*, all wagers are regarded as *pacta illicita*, or unlawful contracts. Hence, no action is competent for the recovery of any sum gained by betting or wagering in any form.—3. In *law*, an offer to make oath of innocence or non-indebtedness; or the act of making oath, together with the oaths of eleven compurgators, to fortify the defendant's oath.

—*Wager of law* was formerly a mode of trial, whereby in an action of debt brought upon a simple contract between the parties, without any deed or record, the defendant might discharge himself by taking an oath that he owed not the plaintiff anything; but he required to bring with him eleven

persons of his neighbours, called *compurgators*, who were to avow upon their oath that they believed in their consciences that he declared the truth. This mode of trial is no longer in use.—

Wager of battle was when the tenant in a writ of right offered to prove his right by the body of his champion, and throwing down his glove as a gage or pledge, thus waged or stipulated battle with the champion of the demandant, who, by taking up the glove, accepted the challenge. The champions, armed with batons, entered the list, and taking each other by the hand, each swore to the justice of the cause of the party for whom he appeared; they then fought till the stars appeared, and if the champion of the tenant could defend himself till that time, his cause prevailed. The *wager of battle*, which had been long disused, was, in 1818, demanded by the nearest relative of a murdered girl, against one Abraham Thornton, her supposed seducer and slayer; this led to its formal abolition, the year after, by the act 59 Geo. 3. c. 46.—To *lay a wager*, to lay down a pledge or surety; to bet.

WAG'ES, *n.* plural in termination, but singular in signification. [Fr. *gage*, *gages*.] 1. Hire; reward; that which is paid or stipulated for services. In *ordinary lan.*, the term *wages* is usually restricted to the sums paid as rewards to artisans, to domestic servants, to labourers employed in manufactures, in agriculture, mines, and other manual occupations. We speak of servant's *wages*, a labourer's *wages*, or tradesmen's *wages*; but we never apply the word to the rewards given to men in office, which are called *fees* or *salary*. The money paid for military and naval services is termed *pay*, and the incomes of clergymen *stipends*.

At present most fast days are popularly called *wakes* in the rural districts of England; but the peculiar *wake* of country parishes was originally the day of the week on which the church had been dedicated; afterwards the day of the year. Every rural parish had its *wake* every year, and most of them had two *wakes*, one on the day of dedication, and another on the birthday of the saint to whom the church was dedicated. The festival

of the dedication has long since been entirely discontinued, while the saint's day festival still subsists in some of the rural districts of England, in the altered form of a *country wake*.—2. Vigils; state of forbearing sleep.

3. The watching of a dead body all night by the friends and neighbours of the deceased; a custom which prevails in Ireland, and was formerly prevalent in Scotland. It most probably originated in a superstitious notion, with respect to the danger of a dead body being carried off by some of the agents of the invisible world, or exposed to the ominous liberties of brute animals. Such *wakes* very early degenerated into scenes of festivity, extremely incongruous to the melancholy occasion.—4. Act of waking. [Old song.]—*Wake of a ship*, the track it leaves in the water, formed by the meeting of the water, which rushes from each side to fill the space which the ship makes in passing through it. This track may be seen to a considerable distance behind the ship's stern, as smoother than the rest of the sea. Hence it is usually observed by the compass, to discover the angle of lee-way. A ship is said to be in the *wake* of another, when she follows her on the same track, or a line supposed to be formed on the continuation of her keel. Two distant objects observed at sea are said to be in the *wake* of each other, when the view of the farthest is intercepted by the nearest, so that the observer's eye and the two objects are all in the same straight line.

The primary sense is simply to move or press, but appropriately, to roll, to press by rolling, as in hatting, and this is the origin of *walker*, for the practice of felting hats must have preceded that of fulling cloth in mills. Our ancestors appropriated the verb to moving on the feet, and the word is peculiarly expressive of that rolling or wagging motion which marks the walk of clownish people. Qu. Heb. *יָלַח*, *yalach*.]

tive of Persia. It is a large handsome tree with strong spreading branches. In France and Germany the wood is much used by turners, cabinet-makers, joiners, coach-makers, and musical-instrument makers; but one of the most important uses of walnut timber is the making of gun-stocks, for which it is considered preferable to any other timber. In this country, however, the walnut-tree is more cultivated for its fruit than its timber. Walnuts are used for the table in almost every stage of their growth. The cotyledons of the seed of the walnut contain an oil, which is used in large quantities, especially on the Continent, by artists and also for lamps. Almost all parts of the plant possess a bitter principle, which acts as a tonic and anthelmintic. There are several distinct varieties of the walnut-tree. Two species are natives of North America, viz. *J. nigra*, or black walnut, and *J. cinerica*, or butternut.

The primary sense of the root is to strive, struggle, urge, drive, or to turn, to twist.] 1. A contest between nations or states, carried on by force, either for defence, or for revenging insults and redressing wrongs, for the extension of commerce or acquisition of territory, or for obtaining and establishing the superiority and dominion of one over the other. These objects are accomplished by the slaughter or capture of troops, and the capture and destruction of ships, towns, and property. Among rude nations, war is often waged and carried on for plunder. As war is the contest of nations or states, it always implies that such contest is authorized by the monarch or the sovereign power of the nation. When war is commenced by attacking a nation in peace, it is called an *offensive* war, and such attack is *aggressive*. When war is undertaken to repel invasion or the attacks of an enemy, it is called *defensive*, and a defensive war is considered as justifiable. When war arises between different portions or members of the same nation, or between the established government of a nation, and a portion of the people resisting it, it is called a *civil* war. Very few of the wars that have desolated nations and deluged the earth with blood, have been justifiable. Happy would it be for mankind, if the prevalence of Christian principles might ultimately extinguish the spirit of war, and if the ambition to be great might yield to the ambition of being good.

Preparation for war is sometimes the best security for peace. *Anon.*

In this country, as in most monarchical governments, the right of declaring war belongs to the sovereign; but formal declarations of war are in modern times out of use, and war is now usually announced by the publication of what is termed a manifesto, the last preliminary step, short of actual hostilities, being the permission of reprisals.—*Council of war*, an assembly of great officers, called by a general or commander, to deliberate with him on enterprises and attempts to be made. The term is sometimes applied also to an assembly of officers sitting in judgment on delinquent soldiers, deserters, coward officers, &c.—*Honours of war*, distinctions granted to a vanquished enemy, as of marching out from a camp or intrenchments with all the insignia of military etiquette. They are generally small, sprightly, and endowed with an incessant activity, in accordance with the subtleness of their flying insect prey. They principally inhabit forests or thicket, and some affect watery situations or reed-marshes. Many are remarkable for the melody of their song, and the sprightliness of their airs, which, in the period of incubation, they almost incessantly pour forth. WARPER, n. One who warps, or prepares the warp of webs for weaving.

WARP'ING, n. Act of him who warps, or that which warps.—2. In *agriculture*, a mode of fertilizing lands by producing a deposition of mud on their surface. This may be practised on the borders of large rivers and estuaries, into which the tides flow, or where floods are frequent; provided, however, that in either case the waters contain alluvial matter in a state of suspension. *Warping* is practised by various proprietors and farmers on the Humber, the Trent, the Ouse, and other rivers. The waters of these rivers, from passing through a great extent of alluvial country, are, after heavy rains, muddy to an excess; and they are in that state conducted over the surface of the adjoining land, and there suffered to deposit their mud, which is technically called *warp*, to the depth of an inch or two, which adds greatly to the fertility of the soil. In order to accomplish the process of *warping*, banks of earth are raised along the course of the rivers, so high that floods or tides cannot pass over them. In these banks there are more or fewer openings, according to the extent of ground to be warped, and other circumstances; but in general, they have only two sluices; the one, called the *floodgate*, to admit, and the other, called the *clough*, to let off the water gently. The floodgate is opened at high water, and the water flows in by one or more channels, made for the purpose of conveying it over the land, and covers it to the depth of high water. The floodgate is then shut, and at low water, the clough is opened, and the water runs out slowly, leaving the sediment behind it.—3. In *arch*. [See **CASTING**.]

WAR'RANTY, *n.* In *law*, a promise or covenant by deed, made by the bargainer for himself and his heirs, to warrant or secure the bargainee and his heirs against all men in the enjoyment of an estate or other thing granted. Such warranty passes from the seller to the buyer, from the feoffor to the feoffee, and from the releaser to the releasee. Warranty is *real*, when annexed to lands and tenements granted in fee or for life, &c., and is in deed or in law; and *personal*, when it respects goods sold or their quality. The use of warranties in conveyances has long been superseded in practice by covenants for title, whereby, as the covenantor engages for his executors and administrators, his personal as well as his real assets are answerable for the performance of the covenant. In common recoveries, a fictitious person is called to warranty. In the sale of goods or personal property, the seller warrants the title; for warranty is express or implied. If a man sells goods which are not his own, or which he has no right to sell, the purchaser may have satisfaction for the injury. And if the seller expressly warrants the goods to be sound and not defective, and they prove to be otherwise, he must indemnify the purchaser; for the law implies a contract in the warranty, to make good any defect. But the warranty must be at the time of sale, and not afterward. In *Scots law*, warranties in insurance are absolute conditions, non-compliance with which voids the insurance. They are either express or implied.—2. Authority; justificatory mandate or precept.

If they disobey any precept, that is no excuse to us, nor gives us any warranty to disobey likewise. *Kettlewell.*

venomous sting. Wasps live in societies, composed of females, male,

8. A period of the night, in which one person or one set of persons stand as sentinels; or the time from one relief of sentinels to another. This period, among the Israelites, seems to have been originally four hours, but was afterward three hours, and there were four watches during the night. Hence we read in scripture of the morning watch, and of the second, third, and fourth watch; the evening watch commencing at six o'clock, the second at nine, the third at twelve, and the fourth at three in the morning; Exod. xiv.; Matt. xiv.; Luke xii.—9. A well known portable machine, generally of a small size, and round flat shape, for measuring time. The moving power in a watch is a spiral spring, and the regulating power the balance wheel, having also a small

spiral spring connected with it, which performs the same office as gravity in the case of the pendulum. The most accurately constructed watches are called *chronometers*, and are used at sea for determining differences of longitude.—*Repeating watch*, or *repeater*, a watch which is supplied with mechanism, by putting which in action, the wearer is enabled, at any time, as during the night, to ascertain the time within certain limits. This is usually effected by compressing a spring which causes a hammer or hammers to strike on a bell or other substance, the hours, quarters, &c.—10. Among *seamen*, a certain number of the ship's crew who are on duty at a time. The crew of every vessel, while at sea, is usually divided into two watches; one called the *starboard watch*, which in the merchant service is the captain's watch; the other the *larboard watch* (or as it is now termed in the royal navy, the *port watch*).—11. The period of time occupied by each part of a ship's crew alternately, while on duty. The period of time called a *watch* is four hours, the reckoning beginning at noon or midnight. Between 4 and 8 p.m., the time is divided into two short or *dog-watches*, in order to prevent the constant recurrence of the same portion of the crew keeping the watch during the same hours. Thus, the period from 12 to 4 p.m. is called the *afternoon watch*, from 4 to 6 the first *dog-watch*, from 6 to 8 the second *dog-watch*, from 8 to 12 the *first night watch*, from 12 to 4 a.m. the *middle watch*, from 4 to 8 the *morning watch*, and from 8 to 12 noon the *forenoon watch*. When this alternation of watches is kept up during the 24 hours, it is termed having *watch* and *watch*, in distinction from keeping all hands at work during one or more watches.—*Anchor watch*, a small watch composed of one or two men appointed to look after the ship while at anchor or in port.—*To set the watch*, to appoint the division of the crew to enter upon the duty of the *watch*.—*To relieve the watch*, to relieve those who have been upon duty by changing the watch.—*Watch* and *ward*, the ancient custom of watching by night, and warding or keeping the peace by day, in towns and cities; a duty imposed upon every inhabitant in turn.

WATER, *n.* (*wau'ter*.) [*Sax. water, was*; *D. water*; *G. wasser*; *Goth. wato*; *Russ. voda*. This may be from the root of *wet*, *Gr. υδωρ*, *Sans. udum*. In *Ar. wadi* signifies a stream, or the channel where water flows in winter, but which is dry in summer; a thing common on the plains of Syria and Arabia.] 1. A fluid, the most abundant and most necessary for living beings of any in nature, except air. Water, when pure, is transparent, colourless, inodorous, tasteless; a powerful refractor of light, an imperfect conductor of heat and electricity; it is very slightly compressible, its absolute diminution for a pressure of one atmosphere being only about 51.3 millionths of its bulk. It assumes the solid form, that of ice or snow, at 32°, and all lower temperatures; and it takes the form of gas or vapour, that of steam, at 212°, and retains that form at all higher temperatures. It possesses the liquid form only at temperatures lying between 32° and 212°. The specific gravity of water is 1, being the unit to which the specific gravities of all solids and liquids are referred, as a convenient standard, on account of the facility with which it is obtained in a pure state; one cubic inch of water at 62°, and 30 inches, barometrical pressure, weighs 252.458 grains. It is 815 times heavier than atmospheric air. Water is at its greatest density at 40°, and in this respect it presents a singular exception to the general law of expansion by heat. If water at 40° be

cooled, it expands as it cools till reduced to 32°, when it solidifies; and if water at 40° be heated, it expands as the temperature increases in accordance with the general law. This expansion of water by cold below 40° produces very important effects in the economy of nature; for if its density increased as it approached the freezing point, large masses of water would become masses of solid ice. In a chemical point of view, water exhibits in itself neither acid nor basic properties; but it combines with both acids and bases forming *hydrates*; it also combines with neutral salts. Water also enters, as a liquid, into a peculiar kind of combination with the greater number of all known substances. Of all liquids, water is the most powerful and general solvent, and on this important property its use depends. Without water, not only the operations of the chemist, but the processes of animal and vegetable life would come to a stand. In consequence of the great solvent power of water, it is never found pure in nature. Even in rain-water, which is the purest, there are always traces of carbonic acid, ammonia, and sea-salt. Where the rain-water has filtered through rocks and soils, and reappears, as spring or river-water, it is always more or less charged with salts derived from the earth, such as sea-salt, gypsum and chalk. When the proportion of these is small the water is called *soft*, when larger it is called *hard water*. The former dissolves soap better, and is therefore preferred for washing; the latter is often pleasanter to drink. The only way to obtain perfectly pure water is to distil it. Distilled water is preserved in clean well stopped bottles, and used in chemical operations. Water is reposit in the earth in inexhaustible quantities, where it is preserved fresh and cool, and from which it issues in springs, which form streams and rivers. But the great reservoirs of water on the globe are the ocean, seas and lakes, which cover more than three-fifths of its surface, and from which it is raised by evaporation, and uniting with the air in the state of vapour, is wafted over the earth, ready to be precipitated in the form of rain, snow or hail. The old chemists regarded water as a simple element; but it is now known to be a compound substance, consisting of hydrogen and oxygen, in the proportion of 2 volumes of the former gas to one volume of the latter; or by weight, it is composed of 1 equivalent of hydrogen, 1, + 1 equivalent of oxygen, 8 = 9 its equivalent; it is in fact a protoxide of hydrogen.—2. The ocean; a sea; a lake; a river; any great collection of water; as, in the phrases, to go by *water*, to travel by *water*.—3. Urine; the animal liquor secreted by the kidneys and discharged from the bladder.—4. The colour or lustre of a diamond or pearl, sometimes perhaps of other precious stones; as, a diamond of the first *water*, that is, perfectly pure and transparent. Hence the figurative phrase, a man or a genius of the first *water*, that is, of the first excellence.—5. *Water* is a name given to several liquid substances or humours in animal bodies; as, the *water* of the pericardium, of dropsy, &c.—*Water of crystallization*, the water which unites chemically with many salts during the

act of crystallizing. It forms an essential part of the crystal, but not of the salt, and is easily expelled by heat, when the crystals generally fall to powder.—*Mineral waters* are those waters which are so highly charged with foreign matters, as to have an unpleasant taste, or to acquire medicinal virtues. WATER-SPOUT, *n.* [*water* and *spout.*] A remarkable meteorological phenomenon observed for the most part at sea, but sometimes over the land. Its general appearance at sea may be thus described:—Below a dense cloud the sea appears to be greatly agitated within a circular area from 100 to 120 yards in diameter, the waves tending rapidly to the centre of the agitated mass, where a vast body of water or aqueous vapour is formed: from hence there rises, with a spiral movement, towards the cloud, a column of a conical form resembling a trumpet. Vertically above this ascending column there is formed, in the cloud, but in an inverted position, a corresponding cone, whose apex gradually approaches that of the ascending column, and at length both are united, and the junction has been observed to be accompanied with a

flash of lightning. The water-spout is said to be accompanied also, during its formation, with a rumbling noise like thunder. The whole column, which after the junction of the two cones, extends from the sea to the clouds, assumes a magnificent appearance, being of a light colour near its axis, but dark along the sides. When acted on by the wind the column assumes a position oblique to the horizon, but in calm weather it maintains its vertical position, while at the same time it is carried along the surface of the sea. Sometimes the upper and lower parts move with different velocities, causing the parts to separate from each other, often with a loud report. The whole of the vapour is at length absorbed in the air, or it descends to the sea in a heavy shower of rain. When a water-spout occurs above land, there is consequently no ascending column of water to meet that which descends. Such water-spouts often burst, discharging immense torrents of rain, and causing great destruction. Water-spouts are supposed by some to be formed by whirlwinds of extreme intensity; while others ascribe their origin to electric agency.

Taken in this wide sense, it would embrace aqueducts, conduits, canals, sluices, locks, fountains, pumps, water-wheels, and hydraulic engines generally. In a narrow sense, the term *water-works* is applied to the methods of simply conducting water in aqueducts, or in pipes for the supply of domestic consumption, or the working of machinery. It comprehends the methods of procuring the supplies necessary for these purposes, by means of pumps, water, or steam-engines. It also comprehends the subsequent management of the water thus conducted, whether in order to make the proper distribution of it according to the demand, or to employ it for the purpose of navigation by lockage, or other contrivances.

WAVE, *n.* [*Sax. weg, way*, a wave, a way; both the same word, and both coinciding with the root of *wag, waggon, vacillate, weigh*, &c. The sense is, a going, a moving, appropriately a moving one way and the other; *G. woge*; *Sw. vag*; *Ir. buaice*.] 1. A moving swell or volume of water; usually, a swell raised and driven by wind. A pebble thrown into still water produces *waves*, which form concentric circles, receding from the point where the pebble fell. But *waves* are generally raised and driven by wind, and the word comprehends any moving swell on the surface of water, from the smallest ripple to the billows of a tempest.

The *wave* behind impels the *wave* before.

Pope.

A *wave*, as it is generally observed, is an elevated portion of water travelling successively along the general surface. When the surface of water is unequally pressed upon, in parts contiguous to each other, the columns most pressed upon are shortened, and sink beneath the natural level of the surface, while those that are least pressed on are lengthened, and rise above that level. As soon as the former columns have sunk to a certain depth, and the latter have risen to a certain height, their motions are reversed, and continue so till the columns that were at first most depressed have become most elevated, and those that were most elevated have become most depressed. In this manner a reciprocating motion is produced, and a series of ridges and hollows is formed, which are called *waves*. When a *wave* of the sea is seen to ad-

vance towards the shore, the water appears to be moving in the same direction; but this is not the case, the only necessary motion of the water being in the vertical direction, so that the water may be perfectly at rest while the *wave* is moving, except this vertical ascent or descent; or it may be moving in any direction coincident with or opposed to the direction in which the *wave* is moving, without at all affecting the motion of the *wave*. The action of the wind upon the surface of the water is the principal cause of the waves which exist, and the height of the *wave* depends in a great measure on the depth of the water in which it is produced. In a sheet of water only a few feet deep the waves will rarely have a height exceeding a few inches; while the waves of the ocean frequently acquire a magnitude sufficient to hide from each other's view two vessels of the largest size, when only a small distance apart. The waves of the sea are of two kinds, *natural* and *accidental*. The natural waves are those which are exactly proportioned in size to the strength of the wind which gives rise to them. The accidental waves are those occasioned by the wind's reacting upon itself by repercussion from hills and mountains, or high shores, and by the washing of the waves themselves against rocks and shoals. Several series of waves moving in different directions may co-exist without destroying each other. Thus it may happen that while a long swell, resulting from some distant storm, is advancing in one direction, a breeze will produce a series of waves moving in the direction of the wind; and a second breeze springing up in another direction will produce a new series, which will become mixed with the former without destroying it. A third gale may also produce a series of waves intersecting the other systems. All these phenomena may be illustrated by throwing several stones into a pool of standing water, when as many series of waves, intersecting each other, will appear upon the surface. The *breadth* of a *wave* is equal to the space between the most elevated points of two adjoining waves, or between the lowest points of two adjoining hollows. A *wave* is said to have passed through its breadth when its elevated part is arrived at the place where the elevated part of the next *wave* stood before; or, the situation of two contiguous waves being given, when one of these has arrived at the place of the other; and the time which is employed in this transition is called the time of a *wave's* motion or the time of an undulation. A *wave* passes through its breadth in the time that a pendulum of half its length (that is, half the length of the surface of the water between the most elevated part of the ridge and the lowest part of the hollow) will perform two of its least vibrations. The *velocity* of a *wave* is the rate at which the points of greatest elevation or depression seem to change their places. *Tidal wave*, the great wave which is raised on the surface of the sea by the attractions of the sun and moon, and which moves from east to west. [See *TIDE*.]—*Artificial waves*, those which are produced by artificial means, as when a stone is thrown into a pool of water. Artificial waves serve to illus-

trate the phenomena of natural waves.—2. Unevenness; inequality of surface.—3. The line or streak of lustre on cloth watered and calendered.—4. Any undulating motion; a motion resembling that of a wave.

WAX, *n.* [Sax. *wax*, *wex*; G. *wachs*; Russ. *waksa*; L. *viscus, viscum*.] 1. A thick, viscid, tenacious substance, excreted by bees, from their bodies, and employed in the construction of their cells; usually called *bees' wax*. Its native colour is yellow, and it has a peculiar smell resembling honey, which is derived from the honey deposited in the cells. When bleached and freed from impurities, wax is white, brittle, and translucent in thin segments; it has neither taste nor smell; it has a specific gravity of from 0.960 to 0.966. It melts at 158° and softens at 86°, becoming so plastic that it may be moulded by the hand into any form.

It is a mixture of two substances in very variable proportions; the one is called *cerine*, and the other *myricine*. Wax is extensively employed both in its original and bleached state; in the latter state it is used for candles, and in numerous cerates, ointments, and plasters. It is also used in forming figures or images, busts, &c., in the preparation of anatomical models, in the preparation of fruit, flowers, and many objects of natural history. In statuary it is used in making models for the metal cast. Wax exists also as a vegetable product, and may in this point of view be regarded as a concrete fixed oil. It may be obtained from the pollen of many flowers, and it forms a part of the green fecula of many plants, particularly of the cabbage. It appears as a varnish upon the fruit, and the upper surface of the leaves of many trees, as in the wax-palm and wax-myrtle.—2. A thick tenacious substance excreted in the ear.—3. A substance found on the hinder legs of bees, derived from the pollen of flowers. This was long supposed to be the substance from which bees elaborated the wax for their cells, but this notion

is now found to be erroneous. The pollen collected by bees serves for the nourishment of their larvæ.—4. A substance used in sealing letters; called *sealing-wax*, or Spanish wax. This is a composition of lac and resin, coloured with some pigment.—5. A thick substance used by shoemakers for rubbing their thread.—*Wax mineral*, a mineral like resinous wax, which is sometimes made into candles. It is otherwise called *ozocerite*.

The *C. andicola*, unlike most other palms, avoids the heat of tropical plains, and thrives best where the temperature of the air is lowered by the proximity of perpetual snow. It is called *Palma de cera* by the Spaniards, and grows to the height of 180 feet. The trunk is marked by rings, caused by the falling off of the leaves, which are eighteen to twenty

feet long, and is covered with a thick secretion, consisting of two-thirds resin

WEDGE, *n.* [Sax. *wecg*, *wæg*; Dan. *weg*; D. *wig*. This word signifies a mass, a lump.] 1. A mass of metal; as, a *wedge* of gold or silver; Josh. vii.

—2. A piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, &c. The wedge is a body contained under two triangular and three rectangular surfaces; as in the figure, where the triangles *ABE*, *DCF*, are the ends, the rectangles *ADER*, *BCEF*, the sides, and the rectangle *ANDC*, the top. The wedge is one of the mechanical powers, and is used for splitting blocks of timber and stone; for

producing great pressure, as in the oil-press; and for raising immense weights, as when a ship is raised by wedges driven under the keel, &c. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the *power* would be to the *resistance* to be overcome, as the *breadth* of the back, *DC*, to the *length* of the side, *DE*, on the supposition that the *resistance* acts perpendicularly to

a native of S. Africa, and constructs an isolated pensile kidney-shaped nest, about seven inches long by four and a half broad, with an opening in the side. The *Euplectes flammeiceps*, or crimson-crowned weaver, is reputed to be a native of Senegal, having the ears and

the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power, we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows; and, further, the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration *D F C*. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges. The angle of the wedge in these cases is more or less acute, according to the purposes to which it is to be applied. The utility of the wedge, in many cases, depends on the great friction which arises between its surface and that of the substance which it divides; for in consequence of this friction it is retained in the position to which it is driven, and prevented from recoiling between the successive blows.—3. Something in the form of a wedge. Sometimes bodies of troops are drawn up in the form of a wedge.

WEDGE, *v. t.* To cleave with a wedge; to rive. [*Little used.*]—2. To drive as a wedge is driven; to crowd or compress closely. We were *wedged* in by the crowd.—3. To be equivalent to in weight; that is, according to the Saxon sense of the verb, to lift to an equipoise a weight on the other side of the fulcrum. To raise; to lift; as an anchor from the ground, or any other body; as, to weigh anchor; to weigh an old hulk.—*Under-weigh.* A vessel is said to be *under-weigh*, when she has weighed anchor or left her moorings. measure of the force by which any body, or a given portion of any substance gravitates to the earth, is ascertained; the process of determining the quantity of matter; or the number of grains, ounces, pounds, hundredweights, &c., which any substance contains. This is effected by balances of various kinds. Accurate weighing is of great importance, since in general it affords one of the best practical means of ascertaining the quantity of matter in bodies, and thence the values of the greater part of the necessaries of life. It is also of great importance in many philosophical experiments. Troy weight is used in philosophical experiments, and in delicate weighing, and the weight is usually reckoned in grains.—2. WEIGHING-HOUSE, *n.* A building furnished with a dock and other conveniences for weighing commodities and ascertaining the tonnage of boats to be used on a canal.

WEIGHING-MACHINE, *n.* Any contrivance by which the weight of an object may be ascertained; as the common balance, spring balance, steelyard, &c., but the term is generally applied to those contrivances which are employed for ascertaining the weight of heavy bodies; as the machine usually employed at the toll-gates on roads for the purpose of determining the weights of laden carriages; machine for weighing cattle; machines for weighing heavy goods, as large casks, bales, &c. Some of these are constructed on the principle of the lever or steelyard, others on that of a combination of levers, and others on that of the spring-balance. They are also called weigh-bridges.

WEIGHT, *n.* (wate.) [Sax. *wiht*; D. *wigt*; G. *gewicht.* See WEIGN.] 1. The quantity of a body, ascertained by the balance; that property of bodies in virtue of which they tend towards the earth's centre of gravity. In a strictly philosophical sense, weight is the measure of the force of gravity, and not gravity itself. Gravity may be considered as a force acting on each of the elementary particles of a body urging it downwards; whereas the weight of a body is the product of the gravity of a single particle, by the number of particles. The weights of two bodies are to one another as the quantities of matter in those bodies; and two bodies are of equal weight which counterpoise each other, when placed at the ends of equal arms of a self-poising lever. As weight is the measure of the force of gravity, it follows that the weight of a body must be increased or diminished according as the force of gravity is increased or diminished. Hence a body that weighs, for instance, one pound at the level of the sea, will, if carried to the top of a mountain, weigh less than a pound, the force of gravity being inversely as the square of the distance from the earth's centre. The diminution of weight, however, at the top of the mountain, could not be indicated by a common balance, because in this instrument, both the weight and its counterpoise are in every situation equally affected by gravity; but if a body that weighs a pound at the level

of the sea, be weighed at the top of a mountain by means of an accurately constructed spring-balance, the diminution of weight which it sustains can be ascertained. It must also be remembered, when weight is to be very accurately taken, that every body is buoyed up to a certain extent by the air; and the weight of a body in air is less than it would be in a vacuum, by the weight of its own bulk of air. Now the air varies in weight in a manner depending upon the temperature, the quantity of moisture contained in it, and other causes. In measuring standards of weight, therefore, close attention must be paid to the state of the air at the time of weighing, and also to the substance weighed.—2. In *commerce*, the measure of the force by which any body, or a given portion of any substance gravitates to the earth. A mass of iron, lead, brass, or other metal, to be used for ascertaining the weight of other bodies; as, an ounce weight, a pound weight, a stone weight, &c. Three systems of weights are admitted as standards in this country; viz., Troy weight used for weighing gold, silver, and precious stones; apothecaries' weight, used for the combination of drugs; and avoirdupois weight, used for all other commodities estimated by weight.—*Standard unit of weight*, a body selected as a standard by comparison, with which the weights of other bodies may be determined, and all other weights used in commerce measured and adjusted. By the Act of Parliament, 1824, the standard brass weight of 1 pound troy, made in the year 1758, then in the custody of the clerk of the House of Commons, was declared to be the original and genuine standard measure of weight, from which all other weights were to be derived, computed and ascertained; and that $\frac{1}{2}$ of the said pound should be reckoned an ounce, $\frac{1}{16}$ of said ounce, a pennyweight, and $\frac{1}{24}$ of said pennyweight a grain, so that 5760 such grains were to constitute a pound troy, also 7000 such grains were to be a pound avoirdupois. The standard pound, however, was destroyed by the burning of the houses of parliament in 1834, and since that time there has been no legal standard unit of weight.—3. In *mech.*, the resistance to be overcome by a machine, whether in raising, sustaining, or moving any heavy body. This resistance is so named, because whatever it be, a weight of equivalent effect may be found. The force which is employed to sustain or overcome the weight or resistance, is called the power.—4. found massive, and crystallized in
octahedral prisms with four-sided py-
ramidal terminations, disseminated in
rocks of greyish or red feldspar. It
is imperfectly lamellar, of a greenish,
greyish, or olive green colour, with a

pearly or resinous lustre. It is softer than feldspar, and melts into a white enamel.

In a *less strict* sense, west is the region of the hemisphere near the point where the sun sets when in the equator. Thus we say, a star sets in the *west*, a meteor appears in the *west*, a cloud rises in the *west*.—2. A country situated in a region toward the sun-setting with respect to another. Thus in the United States, the inhabitants of the Atlantic states speak of the inhabitants of Ohio, Kentucky, or Missouri, and call them people of the *west*; and formerly, the empire of Rome was called the empire of the *West*, in opposition to the empire of the *East*, the seat of which was Constantinople.

WEST, *a.* Being in a line toward the point where the sun sets when in the equator; or in a *looser sense*, being in the region near the line of direction toward that point, either on the earth or in the heavens.

WESTMINSTER ASSEMBLY. A name given to the synod of divines and laymen, who, in the reign of Charles I., assembled, by authority of parliament, in Henry the Seventh's chapel, Westminster, for the purpose of settling the government, liturgy, and doctrine of the Church of England. The great majority of those who attended this assembly were presbyterians. Those members of episcopalian principles refrained from attending, because the king had declared against the assembly. The Westminster Assembly continued in existence for five years and a half. They signed the solemn league and covenant, drew up the Confession of Faith, a Directory for Public Worship, the Larger and Shorter Catechisms, and some other publications of temporary importance.

WE'ZAND, for *Weasand*. [See the *letter*.]

Note.—In words beginning with *wh*, the letter *h*, or aspirate, when both letters are pronounced, precedes the sound of *v*. Thus *what*, *when*, are pronounced *hwat*, *hwen*. So they were written by our ancestors, and so they ought to be written still, as they are by the Danes and Swedes.

WHACK, *v. t.* To strike; to thwack. This is probably the primary word on which is formed *thwack*. [See **TWIR**. *Vulgar and local*.]

WHALE, *n.* [Sax. *hwæl*, *hwæl*; G. *walfisch*, from *wallen*, to stir, agitate, or rove; D. *walvisch*; Sw. and Dan. *hval*.] This animal is named from roundness, or from rolling; for in Dan. *hvalt* is arched or vaulted; *hwæller*, to arch or vault, D. *welven*.] The common name of an order of aquatic mammalia, arranged by zoologists under the name of *Cetacea*. They are characterized by having fin-like anterior extremities, the posterior extremities having their place supplied by a large horizontal caudal fin or tail, and the cervical bones so compressed as to leave the animal without any outward appearance of a neck. In this order are comprised the largest animal forms in existence. Some of the genera are phytophagous, or feed upon plants; others are zoophagous, or feed upon animals. Their abode is in the sea or the great rivers, and they resemble the fishes so closely in external appearance, that not only the vulgar, but even some of the earlier zoologists regarded them as belonging to that class. The *Cetacea* are divided by Cuvier into two great tribes or families, one of which he terms *Herbivorous cetacea*, including the genera *Manatus*, *Haliceore*, and *Stellerus*; and the other, *Ordinary cetacea*, comprising the genera *Delphinus*, *Phocæna*, *Monodon*, *Physeter*, and *Balæna*. The Herbivorous *Cetacea*, however, are rather aquatic pachydermata. The

common or Greenland whale is the *Balæna mysticetus*, so valuable on

account of the oil and whalebone which it furnishes. It is principally found in the Arctic seas, but it is also found, in considerable numbers, in many other parts of the world. Its length is usually about 60 feet, and its greatest circumference from 30 to 40 feet. The razor-backed whale, or northern orqual, is the *Balenoptera physalis*. It is about 100 feet long, and from 30 to 35 feet in circumference. The sperm whale is the *Physeter macrocephalus*, and is about 80 feet in

length, and from 30 to 35 feet in circumference. It is principally found in the Southern ocean, on the coasts of America, Japan, New Guinea, &c., and is much valued on account of the spermaceti and the fine oil which it yields.

These plates or laminae vary in size from 3 to 12 feet in length; the breadth of the largest at the thick end, where they are attached to the jaw, is about a foot, and the average thickness is from four to five tenths of an inch. All above six feet in length are called *size bone*. From its flexibility, strength, elasticity, and lightness, whalebone is employed for many purposes, as for ribs to umbrellas and parasols, for stiffening stays, for the frame-work of hats, &c.

In D. *werven* signifies to raise or levy.] A sort of quay, constructed of wood or stone, on the margin of a roadstead, harbour, or river, alongside of which ships or lighters are brought for the sake of being conveniently loaded or unloaded. There are two kinds of wharfs, viz., *legal wharfs* and *sufferance wharfs*. The former are certain wharfs in all sea ports, at which goods are required to be landed and shipped, by 1 Eliz. c. 11 (now repealed), and subsequent acts. Wharfs in docks and similar situations, are made legal by special acts of parliament; certain wharfs, as at Chepstow, Gloucester, &c., are deemed legal from immemorial usage. *Sufferance wharfs* are places where certain goods may be landed and shipped; as hemp, flax, coal, and other bulky goods, by special sufferance, granted by the crown for that purpose.

WHAT, pron. relative or substitute. [Sax. *hwæt*; Goth. *waiht*; D. *wat*; G. *was*; Dan. and Sw. *hval*; Scot. *quhat*; L. *quod, quid*. The Sax. *hwæt, hwat*, signifies brisk, lively, vigorous; which shows that this pronoun is the same word as *wight*, a living being, from the root of the L. *vivo*, for *vigo*. See **WIGHT**. The Gothic *h* represents the Latin *c*, in *victus*.] 1. That which. Say *what* you will, is the same as say *that which* you will.—2. Which part. Consider *what* is due to nature, and *what* to art or labour.—3. *What* is the substitute for a sentence or clause of a sentence. "I tell thee *what*, corporal, I could tear her." Here *what* relates to the last clause, "I could tear her;" this is *what* I tell you.—4. *What* is used as an adjective, of both genders, often in specifying sorts or particulars. See *what* colours this silk exhibits. I know *what* qualities you desire in a friend; that is, I know the *qualities which* you desire.—5. *What* is much used in asking questions. *What* sort of character is this? *What* poem is this? *What* man is this we see coming?—6. *What* time, at the time or on the day when.

thirty castles, a part or some by force, a part or some by policy; or *what* may be interpreted *partly*. Sometimes *what* has no verb to govern it, and it must be considered as adverbially used. "*What* with carrying apples and fuel, he finds himself in a hurry;" that is, partly, in part.—10. *What* is sometimes used elliptically for *what is this*, or *how is this*?

What! could ye not watch with me one hour? Matt. xxvi.

WHEAL, n. A mine, Cornish dialect.

WHEAT, n. [Sax. *hwæte*; Goth. *hwit*; Ice. *hveitenu*; G. *weizen*; D. *weil*.] A plant of the genus *Triticum*, and the seed of the plant, which furnishes a white flour for bread, and is by far the most important species of grain cultivated in Europe. It grows readily in almost every climate; but its natural home seems to be a temperate climate, and the soils best adapted for its culture are rich clays and heavy loams. Several species of wheat are enumerated by botanists, as summer or spring wheat (*T. aestivum*); winter wheat (*T. hybernum*), common bearded wheat (*T. turgidum*), single grained wheat (*T. monococcum*), Polish wheat (*T. polonicum*), Egyptian wheat (*T. egypciacum*), spelter wheat (*T. spelta*). Many botanists, however, consider most of these as merely varieties, and others look upon all the cultivated wheats as varieties. Of cultivated wheats there are many varieties, but there are three principal ones which claim attention, viz., *hard wheats*, which are the produce of warm climates; *soft wheats*, which grow in the northern parts of Europe, as in Belgium, England, Denmark, and Sweden; and Polish wheats, which grow in Poland. The difference in colour between red and white wheats is owing chiefly to the soil, and, in fact, the varieties of wheat are perpetually changing in consequence of variations of culture, climate, and soil. The wheats cultivated in England are mostly varieties of the winter wheat and common bearded wheat. [See **TRITICUM**.]

WHEAT-EAR, n. An ear of wheat.—2. A small bird, the *Motacilla cyananthe*,

a two-winged gnat, about the tenth of an inch long, and appears about the end of June. The females lay their eggs in clusters of from two to fifteen, among the chaffy flowers of the wheat, where they are hatched in about eight or ten days, producing little footless maggots, whose ravages destroy the flowers of the plant, and render it shrivelled and worthless. [See HESSIAN-FLY.]

WHEEL, *n.* [Sax. *hweol*, *hweohl*, *hweogul*; D. *wiel*; Sw. *hiul*.] A circular frame or solid disc of wood or metal turning on an axis. Wheels, as applied to carriages, usually consist of a nave, into which are inserted spokes or radii, which connect it with the periphery, or circular ring. Wheels are of various kinds; as, carriage wheels, water wheels, toothed wheels, conical wheels, fly wheels, pinions, lanterns, &c. Wheels are most important agents in machinery, being employed in a variety of forms and combinations, for the purpose of transmitting motion, regulating velocity, converting one species of motion into another, reducing friction, and equalizing the effect of forces applied in an intermittent or irregular manner.—*Wheel and axle*, one of the mechanical powers, sometimes named the *axis in peritrochio*, consisting of a wheel with a cylindrical axis of greater or less diameter passing through its centre and turning along with it. By reference to figs. 1, 2,

Fig. 1.

it will be seen that this power resolves

itself into a lever of the first order, in which the weight and power are at the ends, and the fulcrum between them. C is the centre, or fulcrum; A C and C B are the semi-diameters of the wheel and the axle; and on the principle of the lever the power is to the weight as A C is to C B. The wheel is grooved and carries a coil of rope; another rope is secured to the axis; and when the power is in motion, every revolution of the wheel raises the weight to a height equal to the circumference of the axis or cylinder. The power is increased by enlarging the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. There is a modification of the wheel and axle, called the *double axis machine*, in which the power can be increased with more safety. This is shown in figure, 3

where *b* and *c* are two cylinders of different diameters, firmly fixed on the axis carrying the crank *a*. The rope is coiled round the smaller cylinder, carried through a pulley supporting the weight, and then attached to the larger cylinder in a contrary direction. When in motion, every turn of the crank lifts the weight to a height equal to half the difference between the circumferences of the two axes; and the power is therefore to the weight, as this half difference is to the circumference of the power, or the circle described by the crank *a*. Hence the power is increased by making the axes more nearly of the same diameter; but there is a limit to this increase, since if *b* and *c* come to be of equal thickness, the weight would not rise at all; the rope, in that case, wound upon *b* being only equal to that unwound from *c*. The *wheel and axle* is sometimes called the *perpetual lever*, in consequence of the power being *continued* by the revolution of the wheel. The common winch, the windlass, the capstan, and the treadmill, are so many applications of the wheel and axle; and the annexed fig. 4 shows an adaptation of the same principle to a train of wheel-work, wherein motion is regulated and power acquired.

The power F is applied to the circumference of the wheel A, whose pinion drives the wheel B, which by another pinion gives motion to the wheel D, carrying an axle supporting and raising the weight W. The power in this combination is to the weight, as the continued product of the radii of all the wheels, to that of the radii of all the axes.—2. A circular body.—3. A carriage that moves on wheels.—4. An instrument for torturing criminals; as, an examination made by the rack and the *wheel*.—5. A machine for spinning

WHEEL-BOAT, *n.* [wheel and boat.] A boat with wheels, to be used either on water or upon inclined planes or railways.

Under this term writers on mechanics usually include all sorts of vehicles which move on wheels, and are drawn by horses or propelled by steam; as, coaches, chaises, gigs, railway carriages, waggons, carts, &c. The use of wheels in such vehicles is twofold, viz., to lessen the friction, and to enable the vehicle more easily to overcome obstacles on the road.

WHEEL-TIRE, *n.* The iron band that encircles a wooden wheel. [See **TIRE**.]

WHEEL-WINDOW, *n.* In *Gothic arch.*, a circular window with radiating mullions resembling the spokes of a wheel. [See **CATHERINE-WHEEL**.]

WHEEL-WORK, *n.* In *machinery*, the combination of wheels which communicate motion to one another. Such combinations are generally reducible to the principle of the wheel and axle, though the wheel which turns the other is not always on the same axis with it. The motion in such cases is communicated from the one wheel to the other by belts or straps passing over the circumferences of both, or by teeth cut in those circumferences, and working in one another. When the resistance of the work is not great, motion may be transmitted from one wheel to another by causing their peripheries to revolve in contact with each other, by the mere friction of the surfaces in contact. The most familiar instances of wheel-work are to be found in clocks and watches.

WHEEL-WORN, *a.* Worn by the action of moving wheel-tires.

WHEEL-WRIGHT, *n.* [*wheel* and *wright*.] A man whose occupation is to make wheels and wheel-carriages, as carts and waggons.

Here *whether* is a substitute for *one of two*, and signifies *which*; *which* of the two; but in this sense it is obsolete.—2. Which of two alternatives expressed by a sentence or the clause of a sentence, and followed by *or*. "Resolve *whether* you will go or not;" that is, you will go or not go; resolve *which*.

Note.—In the latter use, which is now most common, *whether* is called an adverb. This is a mistake. It is the same part of speech as in the former example. The only difference is that in the former example it represents or refers to a noun, and in the latter to a sentence or clause.

WHICH, pron. This is the probable origin of the word, and its true sense is that of the Latin *quis*, *qualis*, *quicunque*. In these senses it occurs in all Saxon books. Its proper use was as a pronoun of interrogation, "Hwylc man is of eow?" what man is there of you? Matt. vii. 9. "Hwylc is min modor?" who is my mother? Mark iii. 33. Its use for

who, Saxon *hwa*, as in the Lord's prayer, "Our father *which* art in heaven" is an improper application of the word. In its original sense it is used for all genders; as, *which* man, *which* woman, *which* thing? As an interrogative we still use it in this manner. Its use for *who* was of long continuance, but is happily discontinued; and our present practice accords with its original use in the Saxon.] 1. In reference to *things*, or in the neuter gender, it is a relative referring to something before mentioned; as, "God rested on the seventh day from all his work *which* he had made;" Gen. ii. 2. In some phrases, the relative may precede the noun to which it refers.—3. *Which*, like other pronouns, may be used as a substitute for another word or for a sentence. "We are bound to obey all the divine commands, *which* we cannot do without divine aid." Here *which* is a substitute for *obey all the divine commands*. The man was said to be *innocent*, *which* he was not. Here *which* is a substitute for *innocent*.—4. *That* which; those *which*; as, take *which* you will.—*The which*, by the *which*, &c., are obsolete.

In size of body, the Whidah-finch resembles a linnnet or canary-bird, and during the breeding season, the male is supplied with long, drooping, not elegant, but certainly disproportioned tail feathers. *V. paradisæa* is of a deep brownish-black on the upper parts, but paler on the wings. The body, abdomen,

1 Broad-shafted Whidah-finch (*Vidua paradisæa*), and 2 Red-billed Whidah (*Vidua erythrorhynchus*).

and thighs are of a pale buff, and a rich orange-rufon colour nearly surrounds its neck. *V. erythrorhynchus* is less than the former, and is of a deep glossy blue-black colour on the upper parts, with the sides of the head and

under parts white. These birds are commonly called *widow-birds*, but whether this be merely a translation of their Latin generic name, *Vidua*, which was probably given from the sombre hue of the plumage, or whether it be a corruption of Whidah, is uncertain.

WHIG, *n.* The designation of one of the great political parties in this country. The term is of Scottish origin, and was first used in the reign of Charles II. According to Bishop Burnet, it is derived from *whiggam*, a word which was used by the peasants of the south-west of *Scotland*, in driving their horses; the drivers being called *whiggamores*, contracted to *whiggs*. In 1648, after the news of the Duke of Hamilton's defeat, the clergy stirred up the people to rise and march to Edinburgh, and they themselves marched at the head of their parishes. The Marquis of Argyll and his party came and headed them. This was called the *whiggamores'*

inroad, and ever after that all that opposed the court came, in contempt, to be called *whiggs*; and from *Scotland*, the word was brought to *England*, where it has since continued to be used as the distinguishing appellation of the political party opposed to the *Tories*. It was first assumed as a party name by that body of politicians who were most active in placing William III. on the throne of *England*. Generally speaking, the principles of the whigs have been of a popular character, and their measures, when in power, tending to increase the democratic influence in the constitution. WHIP-POOR-WILL, } name of an American bird, the *Caprimulgus vociferus*, allied to the night-hawk or

Whip-poor-will (*Caprimulgus vociferus*).

night-jar, so called from its note, or the sounds of its voice. It appears in Georgia, Louisiana, and Virginia about the middle of March or early in April, and retires about the middle of August. It flies low, and skimming a few feet above the surface of the ground, it settles on logs and fences, from which it pursues the flying moths and insects. Its note is heard in the evening, or early in the morning, and when two or more males meet, their *whip-poor-*

will alterations become rapid and incessant, as if each were straining to overpower or silence the other. During the day these birds retire into the darkest woods, where they repose in silence. Like the owls, their sight seems to be deficient during the day.

[*Sax. hwyrfan*; *G. wirbeln*, to whirl, to warble; *Sw. hvirfla*, to whirl, *Dan. hvirvelben*, whirl-bone, vertebra; *hvirvelsoe*, whirl-sea, a whirlpool; *Sw. hvirvel*, Ice. *whirla*, a whirl. We see that *whirl* and *warble* are dialectical forms of the same word, and both probably from the root of *L. verto* and *Eng. veer*.] To turn round rapidly; to turn with velocity.

WHIRL'ING-TABLE, } *n.* A MA-
WHIRL'ING-MACHINE, } chine con-
trived for the purpose of exhibiting the principal effects of centripetal or centrifugal forces, when bodies revolve in the circumferences of circles, or on an axis. The same name is given to a machine invented by Mr. Robins, for the purpose of determining the resistance of the air against bodies moving with velocities less than those for which the resistance can be determined by the ballistic pendulum. Dr. Hutton made a series of experiments with a machine of this kind, with the view of ascertaining the resistance experienced by military projectiles in passing through the air.

The most celebrated whirlpools are the Euripus, near the coast of Negropont; the Charybdis, in the strait between Sicily and Italy; and the Maelstrom, off the coast of Norway.

WHIRL'WIND, *n.* [*whirl* and *wind*.] A violent wind moving in a circle, or rather in a spiral form, as if moving round an axis; this axis having at the same time a progressive motion rectilinear or curvilinear, on the surface of the land or sea. Whirlwinds are produced chiefly by the meeting of currents of air which run in different directions. When they occur on land they give a whirling motion to dust, sand, part of a cloud, and sometimes even to bodies of great weight and bulk, carrying them either upwards or downwards, and scattering them about in all directions. At sea they often give rise to waterspouts. They are most frequent and violent in tropical countries.

WHIS'PER, *v. i.* [Sax. *hwisprian*; Sw. *hwiska*, to buzz, to whisper; G. *flispfern*; allied to *whistle*, *wheeze*, and L. *fistula*. Thus in an elliptical chamber, if a person standing in one of the foci, speak in a whisper, he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance, under any other circumstances, or at any other place in the chamber. The reason is that the sounds produced in one of the foci of such a chamber, strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus. This serves in some measure to explain the effects of whispering galleries and domes in general. There is a whispering gallery in St. Paul's cathedral, London, and one in Gloucester cathedral.

That faculty or power of the mind by which we determine either to do or not to do, something which we conceive to be in our power; the faculty which is exercised in deciding, among two or more objects, which we shall embrace or pursue. Every man is conscious of a power to determine in things which he conceives

to depend upon his determination. To this power we give the name of *will*; and, as it is usual, in the operations of the mind, to give the same name to the power and to the act of that power, the term *will* is often put to signify the act of determining, which more properly is called *volition*. Volition, therefore, signifies the act of willing and determining, and *will* is put indifferently to signify either the power of willing or the act. Some philosophers, however, give a more extensive meaning to the term *will*, comprehending under it not only our determination to act or not to act, but every motive and incitement to action, but this tends to confound things which are very different in their nature. The *will* is directed or influenced by the judgment. The understanding or reason compares different objects, which operate as motives; the judgment determines which is preferable, and the *will* decides which to pursue. In other words, we reason with respect to the value or importance of things; we then *judge* which is to be preferred; and we *will* to take the most valuable. These are but different operations of the mind, soul, or intellectual part of man. The freedom of the *will* is essential to moral action; but respecting this subject there have been great disputes among philosophers and divines.—2. Choice; determination. It is my *will* to prosecute the trespasser.—3. Choice; discretion; pleasure.
Go, then, the guilty at thy *will* chastise.
Pope.

7. Divine determination; moral purpose or counsel.
Thy *will* be done. Lord's Prayer.

8. In *law*, a testament, the legal declaration of a man's intentions, as to what he wills to be performed after his death in relation to his property. In strictness of language, the term *will* is limited to land, and *testament* to personal estate. Formerly wills were either nuncupative or written; but, according to the Act I. Vict. c. 26, (passed in 1837), by which the making of wills is now regulated, no *will*, whether of real or personal estate, is to be valid, unless it be in writing, and signed at the foot or end by the testator, or by some person in his presence, and by his direction; and such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the *will* in the presence of the testator, but no particular form of attestation is necessary. This act, however, does not affect the wills of soldiers on actual service, or of mariners at sea. These have the power of making nuncupative wills. In the *law of Scotland*, the term *will* is not used technically, at least by itself, although it is sometimes so used in combination, as in the expression *last or latter will*, which is synonymous with *testament*.

In popular language, however, it is employed to signify any declaration of what a person wills, with regard to the disposal of his property, heritable or movable, and thus includes not only testaments, but all the complicated forms of deeds, granted in the prospect of death.—*Will of a summons*, or other *signet letter*, in *Scots law*, that part of the writ beginning, "*Our will is*," &c.—*Good will*, favour; kindness.—2. Right intention; Phil. i.—*Ill will*, enmity; unfriendliness. It expresses less than *malice*.—*To have one's will*, to obtain what is desired.—*At will*. To hold an estate *at the will* of another, is to enjoy the possession at his pleasure, and be liable to be ousted at any time by the lessor or proprietor.—*Will with a wisp*, or *Will o' the wisp*, Jack with a lantern; ignis fatuus; a luminous appearance sometimes seen in the air over moist ground. When an auxiliary verb, the past tense is *would*. It has different significations in different persons.—1. *I will go*, is a present promise to go; and with an emphasis on *will*, it expresses determination.—2. *Thou wilt go, you will go*, express foretelling; simply stating an event that is to come.—3. *He will go*, is also a foretelling. WIND, *n.* [*Sax. wind*; *D. and G. wind*; *W. gwint*; *L. ventus*; *Fr. vent*. This word accords with *L. vento, ventum*, and the Teutonic *wendama*, *Eng. went*. The primary sense is to move, flow, rush, or drive along.] 1. Air in motion with any degree of velocity, indefinitely; a current of air; a current in the atmosphere, conveying the air with greater or less velocity from one part to another; a current as coming from a particular point. When the air moves moderately, we call it a light wind or a breeze; when with more velocity, we call it a fresh breeze; and when with violence, we call it a gale, storm, tempest, or hurricane. The word *gale* is used by the poets for a moderate breeze, but seamen use it as equivalent to *storm*. The principal cause of those currents of air to which we give the name of *winds*, is the disturbance of the equilibrium of the atmosphere by the unequal distribution of heat. When one part of the earth's surface is more heated than another, the heat is communicated to the air above that part, in consequence of which the air expands, becomes lighter, and rises up,

while colder air rushes in to supply its place, and thus produces wind. As the heat of the sun is greatest in the equatorial regions, the general tendency there is for the heavier columns of air to displace the lighter, and for the air at the earth's surface to move from the poles toward the equator. The only supply for the air thus constantly abstracted from the higher latitudes must be produced by a counter-current in the upper regions of the atmosphere, carrying back the air from the equator towards the poles. The quantity of air thus transported, by these opposite currents, is so nearly equal, that the average weight of the air, as indicated by the barometer, is the same in all places of the earth. Besides the unequal distribution of heat already mentioned, there are various other causes which give rise to currents of air in the atmosphere, such as the chemical changes which are carried on in the air, the condensation of the aqueous vapours which are constantly rising from the surfaces of rivers and seas, and the agency of electricity. Winds have been divided into *fixed* or *constant*, as the trade winds; *periodical*, as the monsoons; *land and sea breezes*; and *variable winds*, or such as blow at one time from one point; at another from another point; and at another time cease altogether. [*See* TRADE WINDS, MONSOONS, LAND AND SEA BREEZES.] There are also various local winds, which receive particular names; as the *Etesian wind*, the *Sirocco*, the *Samiel* or *Simoon*, the *Harmattan*, &c. [*See* these terms.] The velocity of the wind varies from one that is hardly sensible, to one of 100 miles in an hour. *Winds* are denominated from the point of compass from which they blow; as, a *north wind*; an *east wind*; a *south wind*; a *west wind*; a *southwest wind*, &c.—2. The *four winds*, the cardinal points of the heavens.

For this purpose, one of the slips is placed across one end of the board, and the other across the other end, with one of the straight-edges of each upon the surface. The joiner then looks in a longitudinal direction over the upper edges of the two slips, and if he finds that these edges coincide throughout their length, he concludes that the surface is *out of winding*; but if the upper edges do not coincide, this is a proof that the surface *winds*. [*See WINDING*.]

WIND'-INSTRUMENT, *n.* An instrument of music, played by wind, chiefly by the breath; as a flute, a clarinet, &c. Wind instruments generally produce their effects by the vibrations of a column of air in a tube, shut at one end, and either open or shut at the other. These vibrations are determined mainly by the length of the sounding column; yet inferior and subordinate ones are found to co-exist with the fundamental one. The whole column spontaneously divides itself into portions equal to the half, the third, or the fourth of its longitudinal extent, and thus different sounds are produced. The finger holes, and keys of wind instruments, are contrivances for varying the length of the sounding column, and thus producing different tones.

WIND'LASS, *n.* [*wind* and *lace*. *Qu.*] In *mech.*, a modification of the wheel and axle, used for raising weights, &c. The common windlass, such as is used for raising water from wells, &c., consists simply of an axle, which is turned by a winch. One end of a rope or

chain being attached to the axle, and the other to a weight, by turning the winch, the rope is coiled on the axle, and thus the weight is raised. The windlass used in ships for raising the anchors, or obtaining a purchase on other occasions, consists of a strong beam of wood placed horizontally, and supported at its ends by iron spindles, which turn in collars or bushes inserted in what are termed the *windlass bits*.

Ship's Windlass.

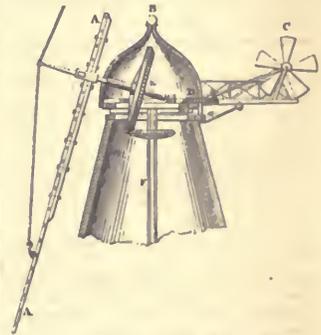

This large axle is pierced with holes directed towards its centre, in which long levers or handspikes are inserted, for turning it round when the anchor is to be weighed or any purchase is required. It is furnished with *pauls* to prevent it from turning backwards when the pressure on the handspikes is intermitted. It is sometimes written *windlace*. Improved patent windlasses are now extensively used in ships.—2. † A handle by which any thing is turned.

Section of upper part of Wind mill.

the wind is made to act upon sails or vanes, A A (generally four in number), attached by means of rectangular frames to the extremities of the principal axis or *wind-shaft* of the mill, which is placed nearly horizontal, so that the sails, by the action of the wind, revolve in a plane nearly vertical, giving a rotatory motion to the driving wheel, E, fixed to the wind-shaft, and thus conveying motion to the vertical shaft, F, and the machinery connected with

it. The extremity of the wind-shaft must always be placed so as to point to the quarter from which the wind blows. To effect this, some mills have a self-adjusting cap, *B*, which is turned round by the force of the wind acting upon the fan or flyer, *C*, attached to the projecting frame-work at the back of the cap. By means of a pinion on its axis, motion is given to the inclined shaft, and to the wheel, *D*, on the vertical spindle of the pinion, *A*, this latter pinion engages the cogs on the outside of the fixed rim of the cap; by these means the sails are kept constantly turned to the wind, the head of the mill moving slowly round, the moment any change in the direction of the wind causes the fan, *C*, to revolve. In the horizontal wind-mill, the wind-shaft is vertical, so that the sails revolve in a horizontal plane. The effect of horizontal wind-mills, however, is considered to be far inferior to that of the vertical kind. The effect of wind-mills depends greatly upon the form and position of the sails.

The word in Spanish signifies also a nostril, that is, a passage. *Ventaja* is advantage; *ventalla*, a valve, and *ventalle*, a fan; *ventear*, to blow. Hence we see that *vent*, *L. vento*, *wind*, *fan*, and *van*, Fr. *avant*, are all of one family. So is also the *L. fenestra*, Fr. *fenêtre*, *D. venster*, *G. fenster*, *Ir. fineog*. The fermented juice of the grape, or of the fruit of the vine, (*vitis vinifera*. *See VITIS*). Wines are distinguished practically, by their colour, hardness or softness on the palate, their flavour, and their being still or effervescing. The differences in the quality of wines depend partly upon differences in the vines, but more on the differences of the soils in which they are planted, in the exposure of the vineyards, in the treatment of the grapes, and the mode of manufacturing the wines. When the grapes are fully ripe, they generally yield the most perfect wine as to strength and flavour. The leading character of wine, however, must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend. The most celebrated ancient wines were those of Lesbos and Chios among the Greeks, and the Falernian and Cecuban among the Romans. The principal modern wines are Port, Sherry, Claret, Champagne, Madeira, Hock, Marsala, Cape, with their varieties. The wines most used in this country are Port and Sherry, especially the former. The wines intended for the English market, are mixed with a large quantity of brandy. Genuine unmixed port wine is very rarely met with in this country.—2. See **WISE**. *Wisdom*, it seems, is from the Gothic dialect.] 1. The right use or exercise of knowledge; the choice of laudable ends, and of the best means to accomplish them. This is wisdom in *act*, *effect*, or *practice*. If wisdom is to be considered as a *faculty* of the mind, it is the faculty of discerning or judging what is most just, proper, and useful; and if it is to be considered as an *acquirement*, it is the knowledge and use of what is best, most just, most proper, most conducive to prosperity or happiness. Wisdom in the first sense, or *practical wisdom*, is nearly synonymous with *discretion*. It differs somewhat from *prudence*, in this respect; *prudence* is the exercise of sound judgment in avoiding evils; *wisdom* is the exercise of sound judg-

ment either in avoiding evils or attempting good. *Prudence* then is a species, of which *wisdom* is the genus.

Wisdom gained by experience, is of inestimable value.

This in Dutch, is *veeten*, to know, which is the Goth. *witan*, *Sax. witan*, *Eng. to wit*, perhaps *Gr. wida*. So that *wise, wit, weet, wot*, are all from one root, or dialectical forms of the same word; *Ir. fois, feas*, knowledge; *W. guys, guyz*, *Sans. widja*, intelligence. In general, the radical sense of *know*, is to reach or to hold, from extension, stretching. In this case, it may be to show, to disclose, from a like sense; for in *Sw. visa*, *Dan. viser*, *G. weisen*, *D. wysen*, is to show. In this case, *L. video, visum*, which seems to be connected with this word, may coincide in origin with *wide*. *Wistful*, attentive, eager, is from reaching forward.] 1. Properly, having knowledge; hence, having the power of discerning and judging correctly, or of discriminating between what is true and what is false; between what is fit and proper and what is improper; as, a *wise* prince; a *wise* magistrate. Solomon was deemed the *wisest* man. But a man may be *speculatively* and not *practically* wise. Hence,—2. WIT, *v. i.* [Sax. *witan*, Goth. *witan*, D. *wætan*, G. *wissen*, to know; Sans. *vid*. See *WISE*.] To know; to be informed; to be known. This verb is used only in the infinitive, to *wit*, when it is an adverbial phrase, signifying, namely, that is to say. [See *VIDELICET*.]

2. The association of ideas in a manner natural, but unusual and striking, so as to produce surprise joined with pleasure. Wit is defined

What oft was thought, but ne'er so well express'd. *Pope.*

Wit consists in assembling and putting together with quickness, ideas in which can be found resemblance and congruity, by which to make up pleasant pictures and agreeable visions in the fancy. *Locke.*

Wit consists chiefly in joining things by distant and fanciful relations, which surprise us because they are unexpected.

Kames.
Wit is a propriety of thoughts and words; or in other terms, thoughts and words elegantly adapted to the subject. *Dryden.*

7. Faculty of the mind.—8. *Wits*, in the plural, soundness of mind; intellect not disordered; sound mind. No man in his *wits* would venture on such an expedition. Have you lost your *wits*? Is he out of his *wits*?—9. Power of invention; contrivance; ingenuity. He was at his *wits'* end.—10. Among *phrenologists*, the faculty which produces the sentiment of the ludicrous; and gives the tendency to view objects in that light. When combined with *destructiveness* it produces satire, and

when combined with *secretiveness* it produces humour. Its organ is situated at the side of the upper part of the forehead, between causality and ideality.

Note.—It is difficult to give any strict definition of the term *wit*, its precise boundaries being still too unsettled. It has passed through a greater variety of significations in the course of the last two centuries than most other terms in the English language. Originally, *wit* signified wisdom; and anciently, a man of *witte* was a wise man. In the reign of Elizabeth, a man of pregnant *wit*, or of great *wit*, was a man of vast judgment. In the reign of James I. *wit* was used to signify the intellectual faculties or mental powers collectively. In the time of Cowley it came to signify a superior understanding, and more particularly a quick and brilliant reason. By Dryden it is used as nearly synonymous with talent or ability. According to Locke, it consists in quickness of fancy and imagination. Pope defined *wit* to be a quick conception and an easy delivery; according to which, a man of *wit*, or a *wit*, is a man of brilliant fancy; a man of genius. At present, *wit* is used to designate a peculiar faculty of the mind, connected with the more comprehensive faculty of the imagination; and also the effect produced by this faculty, which consists in the display of remote resemblances between dissimilar objects, or an unexpected combination of remote resemblances; in the exhibition or perception of ludicrous points of analogy or resemblance among things in other respects dissimilar. Hence, a man of *wit*, or a *wit*, is considered to be a man in whom a readiness for such exercise of the mind is remarkable. It is evident that *wit* excites in the mind an agreeable surprise, and that arising, not from any thing marvellous in the subject, but solely from the imagery employed or the strange assemblage of related ideas presented to the mind. This end is effected, 1, by debasing things pompous or seemingly grave; 2, by aggrandizing things little and frivolous; or, 3, by setting ordinary objects in a particular and uncommon point of view, by means not only remote, but apparently contrary. Hence arise a great many kinds of wit. Wit is often joined with humour, but not necessarily so; it often displays itself in the keenest satire; but when it is not kept under proper control, or when it becomes the habitual exercise of the mind, it is apt to impair the nobler powers of the understanding, to chill the feelings, to check friendly and social intercourse, and to break down those barriers which have been established by courtesy. At the same time, when kept within its proper sphere, and judiciously used, it may be rendered very effective in attacking pedantry, pretension, or folly, and may also be employed as a powerful weapon against error.

WITCH'CRÄFT, *n.* [*witch* and *craft.*] The practices of witches; sorcery; enchantments; intercourse with the devil; a supernatural power, which persons were formerly supposed to obtain possession of by entering into compact with the devil. Indeed it was fully believed that they gave themselves up to him, body and soul, while he engaged that they should want for nothing, and be able to assume whatever shape they pleased, to visit and torment their enemies, and accomplish their infernal purposes. As soon as the bargain was concluded, the devil was said to deliver to the witch an imp or familiar spirit, to be ready at call, and to do whatever it was directed. By the aid of this imp and the devil together, the witch, who was almost always an old woman, was enabled to transport herself through the air on a broomstick or a spit, and to transform herself into various shapes, particularly those of cats and hares; to inflict diseases on whomsoever she pleased, and to punish her enemies in a variety of ways. The belief in witchcraft is very ancient. It was universally believed in Europe till the 16th century, and even maintained its ground with tolerable firmness till the middle of the 17th century. Vast numbers of reputed witches were condemned to be burned every year, so that in England alone it is computed that no fewer than 30,000 of them suffered at the stake.—2. Power more than natural.

The meetings of this council were frequent; they formed the highest court of judicature in the kingdom; they were summoned by the king in any political emergency; their concurrence was necessary to give validity to laws, and treaties with foreign states were submitted to their approval. They had even power to elect the king, and if the sceptre descended

in his race, it was by means of the formal recognition of the new king by the nobles, bishops, &c., in an assembly convened for the purpose.

With and *by* are closely allied in many of their uses, and it is not easy to lay down a rule by which their uses may be distinguished. It is observed by Johnson that *with* seems rather to denote an instrument, and *by* a cause; as, he killed an enemy *with* a sword, but he died *by* an arrow. But this rule is not always observed. *With*, in composition, signifies sometimes opposition, privation; or separation, departure.

great extent in Britain, on account of the blue dye extracted from it. It is now, however, nearly superseded by indigo, which gives a stronger and finer blue. It is still cultivated to a considerable extent in the south of France and Flanders, and the dye which it furnishes is said to improve the quality and colour of indigo, when mixed with it in a certain proportion. The colouring matter is obtained from the leaves of the plant. These are first dried, then ground or bruised by machinery, and formed into a sort of paste. This paste is formed into balls, which are allowed to ferment and fall into a dry powder, which is sold to the dyer. The height at the shoulder from 27 to 29 inches. The wolf is a crafty, greedy, and ravenous animal; the sheep-cote and the farm-yard become the scenes of his ravages, and the size and speed of the elk and of the stag are not sufficient to protect them from his violence, his swiftness, and his cunning. When pressed by famine, he becomes dangerous to man, falling at unawares upon the solitary and unprotected traveller, and carrying off the defenceless children of the villager. Sometimes wolves pursue their prey in companies, which separate again as soon as the object of the pursuit is attained. The common wolf infests the western countries of Europe, and once lurked in the uncleared woody districts of Britain. There are several species of wolf; as, the *black-wolf* of Southern Europe, and particularly of the Pyrenees, and south of those mountains; the *red-wolf* of South America. The juice of the leaves introduced into the stomach is said to occasion death in a short time, but the powdered root is far more energetic. Others, however, derive the word from the Sax. *wif-man*, plur. *wif-men*; Sax. *wif*; Dan. *wiif*, *wiiven*; G. *weib*, from *weben*, to weave. According to this latter etymology, *wifman* would signify the *web* or *woofman*, this name having been given to the female from her employment at the *woof*, and in support of this we find in the *Anglo-Saxon* version of the scriptures, Matt. xix. 4, the male called *wæpman*, the *weapon-man*, from his occupation in weapons of war, the female being called *wifman*.] 1. Workhouses were employed for two different purposes. Some were used as prisons for vagrant or sturdy beggars, who were there confined and compelled to labour; whilst others, sometimes called *poor-houses*, were large alms houses, for the maintenance and support of the indigent and such able-bodied persons as were out of employment. Previous to the passing of the poor-law amendment act in 1834, these workhouses were described as generally speaking, nurseries of idleness, ignorance, and vice. By the act alluded to, parishes were united for the better management of workhouses, which gave rise to the poor-law unions. New workhouses, capable of containing from 100 to 500 inmates, have been erected in nearly every poor-law union. In these establishments, a suitable classification of the pauper inmates has been effected, and proper government and discipline instituted. The paupers of the several classes, are kept employed according to their capacity and ability. Religious and secular instruction is supplied, habits of industry, cleanliness, and order are enforced; and wholesome food and sufficient clothing are furnished.

In order to compensate for the pressure of the external air, when any absorption takes place which might tend to force the fluid from the bottles back into the receiver *b*, each one is provided with a safety tube *f*, open at the top, which dipping little more than half an inch under the surface of the fluid, permits sufficient air to enter as a compensation for absorption.

1. The period of time during which the earth makes one complete revolution in its orbit, or it is the space or period of time which elapses between the sun's leaving either equinoctial point, or either tropic, and his return to the same. This is the solar year, and the year, in the strict and proper sense of the word. It is called also the tropical year. This period comprehends what are called the twelve calendar months. It is not quite uniform, but its mean length is about 365 days, 5 hours, 48 minutes, and 48 seconds. The return of the seasons depends upon it. In popular usage, however, the year consists of 365 days, and every fourth year of 366; a day being added to February, on account of the excess of the solar year above it.—2. The time in which any planet completes a revolution; as, the year of Jupiter or of Saturn.—3. The time in which the fixed stars make a revolution, is called the *great year*.—4. *Years*, in the plural, is sometimes equivalent to age or old age; as, a man in *years*. In popular language, year is

often used for *years*. The horse is ten *year* old.—*Sideral year*, the time between the sun's leaving any point among the fixed stars and his return to the same; that is, the time of the sun's apparent revolution in the ecliptic. This is 365 days, 6 hours, 9 minutes, and 11.5 seconds. The excess of the sidereal above the solar year, arises from the retrograde motion of the equinoctial points, owing to which the sun returns to either equinoctial point or either tropic, before returning to the same fixed star.—*Anomalous year*, the time that elapses from the sun's leaving its apogee, till it returns to it; which is 365 days, 6 hours, 14 minutes nearly.—*Civil year*, the year of the calendar, consisting of 365 days, and every fourth year of 366 days.—*Bis-sextile or leap year*, the year consisting of 366 days.—*Lunar year*, consists of 12 lunar months.—*Lunar astronomical year*, consists of 12 lunar synodical months, or 354 days, 8 hours, 48 minutes, 36 seconds.—*Common lunar year*, consists of 12 lunar civil months, or 354 days.—*Embolismic or intercalary year*, consists of 13 lunar civil months, and contains 384 days.—*Julian year*, established by Julius Cesar, consists of 365 days, 6 hours.—*Gregorian year*, is the Julian year corrected, and is the year now generally used in Europe. From the difference between this and the Julian year, arises the distinction of Old and New Style. [See **STYLE**.]—*Sabbatic year*, among the Israelites, was every seventh year, when their land was suffered to lie untilled. The *civil or legal year*, in England, formerly commenced on the 25th day of March. This practice continued throughout the British dominions till the year 1752. [See **TIME**.]—*A year and day*, in law, the lapse of a year with a day added to it, a period which determines a right, or works prescription; as in the case of an estray, if the owner does not claim it within that time, it becomes forfeited to the lord; so of a wreck, &c. YT'TRIA, *n.* [so called from *Ytterby*, a quarry in Sweden.] A metallic oxide, or earth, having the appearance of a white powder, which is insipid, insoluble in water, and infusible. It dissolves in acids, forming sweetish salts, which have often an amethyst colour. It has no action on vegetable colours. *Yttria* seems to be a protoxide of yttrium, its metallic base. It was discovered in 1794, by Professor Gadolin, in a mineral found at *Ytterby*, called from him *gadolinite*. It also occurs in *ytthro-cerite* and *ytthro-tantalite*.

It is a brittle metal, and is not oxidized either in air or water, but when heated to redness it burns with splendour, even in atmospheric air, and with far greater brilliancy in oxygen gas. This metal, or rather its oxide, is so rare as not to admit of any useful application.

YTTRO-CER'ITE, *n.* A mineral occurring very sparingly at *Finbo* and *Brodbo*, near *Fahlun* in Sweden, imbedded in quartz. Its colour is violet-blue, inclining to gray and white. It is sometimes white. These colours generally alternate in layers, in the same specimen. It occurs crystallized and massive, and consists of fluoric acid, *yttria*, oxide of cerium, and lime. Before the blow-pipe it is infusible, but loses its colour and becomes white. It is acted on by acids, and the solution gives a precipitate soluble in carbonate of ammonia.

muclilaginous juice which has a nauseous odour, and an unpleasant taste, arising from the existence in it of a peculiar proximate principle. This may be removed by boiling, roasting, &c., when some of them form a nutritious article of food. The pith of *Z. cycadis*, Bread-tree *Zamia*, after being prepared in a particular way, is formed into cakes, baked, and eaten by the Caffres and Hottentots. *Z. spiralis* produces large cones composed of nuts about the size of a chestnut, which are eaten by the natives of New Holland.

The zebras graze in herds on the steep hill side, and seek the wildest and most sequestered spots, so that they are extremely difficult of approach, not only from their watchful habits and great swiftness of foot, but also from the inaccessible nature of their abode. They are incapable of being tamed, unless they are taken very young. There is another species of zebra, *E. burchellii*, which inhabits the plains of South Africa, beyond the Orange river. It is a beautiful animal, having the ears and tail more like those of the horse than the preceding species, which approaches the ass in these particulars. It admits of being tamed to a certain extent, but even in its most tractable state it is described as wicked, treacherous, obstinate, and fickle. A portion of land is assigned to him as subsistence-allowance, and as collector of the revenue he has a per centage (generally ten per cent.) upon the amount collected. The opposite pole of the celestial horizon is termed the *nadir*, and a vertical line or plane will, if produced, pass through the zenith and nadir, the spectator's place being considered as the centre of the celestial sphere. A plumb line, hanging freely and at rest, is directed to the zenith and nadir. All vertical circles or azimuths necessarily pass through the zenith.

It consists essentially, as its name implies, of a portion of a divided circle. [See SECTOR.]

ZE'OLITE, *n.* [Gr. *ζέω*, to boil, to foam, and *λίθος*, stone.] A class of earthy minerals, so named originally by Cronstedt, from their boiling and swelling when heated by the blow-pipe. Many substances have been confounded under this name, particularly such as are fusible by the blowpipe without addition, and exhibit a phosphoric brilliancy at the moment of fusion. Haüy makes two species of zeolite, which he calls mesotype and stilbite. Werner makes four subspecies, which he calls mealy zeolite, fibrous zeolite, radiated zeolite, and foliated zeolite. He makes zeolite a generic name, and Jameson, who adopts this theory, arranges in this family prehnite, zeolite, apophyllite, cubicite, called by Haüy analcime, chabasite, cross-stone, laumonite, di-pyre, natrolite, and wavelite. According to Dr. Thomson, the zeolites, chemically considered, are, double hydrous, aluminous silicates. Under this head are included apophyllite, talc, harmotome, itnerite, karpholite, levyne, laumonite, mesolite, natrolite, pyrophyllite, steatite, thomsonite, agalmatolite, analcime, chabasite, comptonite, stilbite, zeuxite, and various other minerals.

ZINC, *n.* [G. Sw. and Dan. *zink*.] A metal frequently called *spelter* in commerce. It has a strong metallic lustre, and a bluish white colour. Its texture is lamellated and crystalline, and its specific gravity about 7. It is a hard metal, being acted on by the file with difficulty; and its toughness is such as to require considerable force to break it when the mass is large. At low or high degrees of heat it is brittle, but between 250° and 300°, it is both malleable and ductile, and may be rolled or hammered into sheets of considerable thinness, and drawn into wire. Its malleability is considerably diminished by the impurities which the zinc of commerce contains. It fuses at 773°, and when slowly cooled, crystallizes in four or six sided prisms. Zinc undergoes little change by the action of air and moisture. When fused in open vessels, it absorbs oxygen and forms the white oxide called *flowers of zinc*. Heated strongly in air it takes fire and burns with a beautiful white light, forming oxide of zinc. Zinc is found in considerable abundance. It does not occur in the native state, but is obtained from its ores which are chiefly the sulphuret, or *zinc blende*, and the carbonate or *calamine*. The oxide of zinc is a fine white powder insoluble in water, but very soluble in acids which

it neutralizes, being a very powerful base, of the same class as magnesia. It combines also with some of the alkalies. Several of the salts of zinc are employed in medicine, as the sulphate or *white vitriol*, the chloride or *butter of zinc*, the acetate and the cyanuret. Sheet-zinc is now largely employed for lining water cisterns, baths, &c., for making spouts, pipes, for covering roofs, and several other architectural purposes. Plates of this metal are used as generators of electricity in voltaic batteries, &c.; they have also been recently employed in the operation of transferring printing. Zinc is much employed in the manufacture of brass and other alloys. A new application of this metal has been lately announced, namely, that of producing what is termed the *electric light*, to be used as a substitute for gas.

Thus zoology treats of all those beings comprised in the term "animal kingdom." It embraces *comparative anatomy*, *animal physiology*, and all the great questions relating to the succession of species of animals upon the earth, the parts which they play in the theatre of nature, and the geographical distribution of existing species; another branch, termed *descriptive zoology*, is restricted to the outward characters, habits, properties, and the classification of animals. Various systems of classification have been framed by zoologists. Linnæus divided the animal kingdom into six classes, viz., *mammalia*, *birds*, *fishes*, *amphibials*, *insects*, and *worms* (vermes). Cuvier gives a more definite arrangement. He divides the animal kingdom into four sub-kingdoms, viz., *vertebrata*, *mollusca*, *articulata*, and *radiata*. zoophytes, or *zoophyta*, form a great division of the animal kingdom, comprehending beings which are always evidently more simple in organization than in the other divisions, and which have their parts more or less distinctly arranged round an axis, a disposition which frequently gives them the shape of flowers, and hence the name, which signifies *living plants*, or *plant-like animals*. This division contains the starfishes and sea-eggs, as well as the actiniae, corals, and corallines.
